- immune-mediated complications: scarlet fever, acute rheumatic fever, post-streptococcal glomerulonephritis, reactive arthritis, pediatric autoimmune neuropsychiatric disorder associated with group A *Streptococci* (PANDAS)

## SCARLET FEVER

- diffuse erythematous eruption
- delayed-type hypersensitivity reaction to pyrogenic exotoxin produced by Group A *Streptococcus*
- acute onset of fever, sore throat, strawberry tongue
- 24-48 h after pharyngitis, rash begins in the groin, axillae, neck, antecubital fossa; Pastia's lines may be present
- within 24 h, sandpaper rash becomes generalized with perioral sparing, non-pruritic, non-painful, blanchable
- rash fades after 3-4 d, may be followed by desquamation
- treatment is penicillin, amoxicillin, or erythromycin x 10 d

## RHEUMATIC FEVER

- inflammatory disease due to antibody cross-reactivity following GAS infection
- affects ~1:10,000 children in developed world; much more prevalent in developing nations; peak incidence at 5-15 yr of age
- mainly a clinical diagnosis based on Jones Criteria (revised)
  - requires 2 major OR 1 major and 2 minor (see sidebar) PLUS evidence of preceding strep infection [history of scarlet fever, group A streptococcal pharyngitis culture, positive rapid Ag detection test, anti-streptolysin O titers (ASOT)]
- treatment
  - penicillin or erythromycin for acute course x 10 d
  - prednisone if severe carditis
- secondary prophylaxis with daily penicillin or erythromycin
- complications:
  - acute: myocarditis, conduction system aberrations (sinus tachycardia, atrial fibrillation), valvulitis (acute MR), pericarditis
  - chronic: valvular heart disease (mitral and/or aortic insufficiency/stenosis), infectious endocarditis ± thromboembolic phenomenon
  - onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever

### McIsaac Criteria (if >3 yr old)

#### HOT LACE

**Hot** – Fever >38° C

**Lymphadenopathy**: anterior, tender, cervical

**Age** 3-14 yr

**No Cough**

**Erythematous**, exudative tonsils

CMAJ 1998;158(1):75-83

### Scarlet Fever

#### 4 Ss and 4 Ps

**Sore throat**

**Swollen tonsils**

**Strawberry tongue**

**Sandpaper rash**

**Perioral Sparing**

**Non-Pruritic**

**Non-Painful**

**Peeling**

### Jones Criteria

#### Major: STREP

Sydenhams chorea

Transient migratory arthritis

Rheumatic subcutaneous nodules

Erythema marginatum

Pancarditis (endocarditis, myocarditis, pericarditis)

#### Minor: PEACE

PR interval prolonged

ESR elevated

Arthralgias

CRP elevated

Elevated temperature (fever)

**POST-STREPTOCOCCAL GLOMERULONEPHRITIS**

- glomerular immune complex disease following primary GAS infection of pharynx or skin
- most common in children aged 4-8 yr old; M>F
- antigen-antibody mediated complement activation with diffuse, proliferative glomerulonephritis
- occurs 1-3 wk following initial GAS infection (skin or throat)
- clinical presentation varies from asymptomatic, microscopic and macroscopic (cola coloured urine) hematuria to all features of nephritic syndrome (see P82)
- diagnosis is confirmed with elevated serum antibody titres against streptococcal antigens (ASOT, anti-DNaseB), low serum complement (C3)
- management:
  - symptomatic: fluid and sodium restrictions; loop diuretics for hypertension and edema
  - in severe cases, may require dialysis if renal function significantly impaired
  - treat with penicillin or erythromycin if evidence of persistent GAS infection
- 95% of children recover completely within 1-2 wk; 5-10% have persistent hematuria

## Meningitis

**Definition**

- inflammation of the meninges surrounding the brain and spinal cord

**Epidemiology**

- peak age: 6-12 mo; 90% of cases occur in children <5 yr old

**Etiology**

- viral: enteroviruses, herpes simplex virus (HSV)
- bacterial: age-related variation in specific pathogens (see Table 25)
- fungal and parasitic meningitis also possible
- most often due to hematogenous spread or direct extension from a contiguous site

**Risk Factors**

- unvaccinated
- immunocompromised: asplenia, diabetes mellitus, HIV, prematurity
- recent or current infections: AOM, sinusitis, orbital cellulitis,
- neuroanatomical: congenital defects, dermal sinus, neurosurgery, cochlear implants, recent head trauma
- exposures: day care centres, household contact, recent travel

**History**

- signs and symptoms variable and dependent on age, duration of illness and host response to infection
- infants: fever, lethargy, irritability, poor feeding, vomiting, diarrhea, respiratory distress, seizures
- children: fever, headache, photophobia, N/V, confusion, back/neck pain/stiffness, lethargy, irritability

**Physical**

- infants: toxic, hypothermia, bulging anterior fontanelle, respiratory distress, apnea, petechial/purpuric rash, jaundice, omphalitis
- children: toxic, ↓ LOC, nuchal rigidity, Kernig's and Brudzinski's signs, focal neurologic findings, petechial/purpuric rash

**Investigations**

- blood work: CBC, electrolytes, Cr, BUN, glucose, culture with sensitivity
- lumbar puncture required for definitive diagnosis
  - Gram stain, bacterial culture and sensitivity, WBC count and differential, RBC count, glucose, protein concentration (Table 24)
  - acid-fast stain if suspect TB
  - latex agglutination tests or PCR for specific bacteria if available (helpful if already treated with antibiotics)
  - CSF cloudy in bacterial meningitis
  - urinalysis and urine C&S in infants, Gram stain and culture of petechial/purpuric lesions

**Signs of Meningismus**

**BONK on the head**  
Brudzinski's sign  
Opisthotonos\*  
Nuchal rigidity  
Kernig's sign

\*Opisthotonos: rigid spasm of the body, with the back fully arched and the heels and head bent back

**Table 24. CSF Findings of Meningitis**

Component	Normal Child	Normal Newborn	Bacterial Meningitis	Viral Meningitis	Herpes Meningitis
WBC (/μL)	0-6	0-30	>1000	100-500*	10-1000
Neutrophils (%)	0	2-3	>50	<40	<50
Glucose (mg/dL)	40-80	32-121	<30	>30	>30
Protein (mg/dL)	20-30	19-149	>100	50-100	>75
RBC (/μL)	0-2	0-2	0-10	0-2	10-50

\*Lymphocytes predominate Modified from Peds in Review 1993;14:11-18 and Ped Inf Dis J 1996;15:298-303

### Management

- supportive care
  - preservation of adequate cerebral perfusion by maintaining normal BP and managing ↑ ICP
  - close monitoring of fluids, electrolytes, glucose, acid-base disturbances, coagulopathies
- bacterial meningitis
  - if suspected or cannot be excluded, commence empiric antibiotic therapy while awaiting cultures or if LP contraindicated or delayed
  - adjuvant dexamethasone BEFORE antibiotic for Hib meningitis; consider for those >6 wk with pneumococcal meningitis
  - isolation with appropriate infection control procedures until 24 h after culture-sensitive antibiotic therapy
  - fluid restrict if any concern for SIADH
  - hearing test
  - report to public health; prophylactic antibiotics for close contacts of Hib and *N. meningitidis* meningitis

**Table 25. Antibiotic Management of Bacterial Meningitis**

Age	Main pathogens	Antibiotics
0 to 28 d	GBS, <i>E. coli</i> , <i>Listeria</i> Other: Gram-negative bacilli	Ampicillin + cefotaxime
28 to 90 d	Overlap of neonatal pathogens and those seen in older children	Ampicillin + cefotaxime ± vancomycin
>90 d	<i>S. pneumoniae</i> , <i>N. meningitidis</i>	Ceftriaxone ± vancomycin

- viral meningitis
  - mainly supportive (except for HSV)
  - acyclovir for HSV meningitis
  - report to public health
- prophylaxis: appropriate vaccinations significantly decrease incidence of bacterial meningitis (see *Routine Immunization*, P3)

### Complications

- mortality: neonate 15-20%, children 4-8%; pneumococcus > meningococcus > Hib
- acute: SIADH, subdural effusion/empyema, brain abscess, disseminated infection (osteomyelitis, septic arthritis, abscess), shock/DIC
- chronic: hearing loss, neuromotor/cognitive delay, learning disabilities, neurological deficit, seizure disorder, hydrocephalus

## Mumps

### Definition

- acute, self-limited viral infection that is most commonly characterized by adenitis, and swelling of the parotid glands

### Epidemiology

- incidence in Ontario has declined since introduction of two-dose MMR vaccination schedule
- average of 25 reported cases per year
- majority of reported cases in children between 5-10 yr of age

### Etiology

- Mumps virus (RNA virus of the genus *Rubulavirus* in the *Paramyxoviridae* family)
- transmission via respiratory droplets, direct contact, fomites
- incubation period: 14-25 d
- infectivity period: 7 d pre-parotitis-5 d post-parotitis
- upper respiratory tract → lymph nodes → salivary glands, gonads, pancreas, meninges, kidney, heart, thyroid

**History**

- non-specific prodrome of fever, headache, malaise, myalgias (especially neck pain)
- usually followed within 48 h by parotid swelling secondary to parotitis (bilateral, preauricular, ear pushed up and out)
- parotid gland is tender and pain worsened with spicy or sour foods
- one third of infections do not cause clinically apparent salivary gland swelling and may simply present as an URTI

**Investigations**

- clinical diagnosis, but may be confirmed with IgM positive serology within 4 wk of acute infection
  - may also use PCR or viral cultures from oral secretions, urine, blood, and CSF
  - blood work: CBC (leukopenia with relative lymphocytosis), serum amylase (elevated)

**Management**

- mainly supportive: analgesics, antipyretics, warm or cold packs to parotid may be soothing
- admit to hospital if serious complications (meningitis, pancreatitis)
- droplet precautions recommended until 5 d after onset of parotid swelling
- prophylaxis: routine vaccination (see *Routine Immunization*, P3)

**Complications**

- common: aseptic meningitis, orchitis/oophoritis
- less common: encephalitis, pancreatitis, thyroiditis, myocarditis, arthritis, glomerulonephritis, ocular complications, hearing impairment

## Pertussis

**Definition**

- prolonged respiratory illness characterized by paroxysmal coughing and inspiratory “whoop”

**Epidemiology**

- ~10 million children <1 yr old affected worldwide, causes up to 400,000 deaths per year
- greatest incidence among children <1 yr (not fully immunized) and adolescents (waning immunity)

**Etiology**

- *Bordetella pertussis*: Gram negative pleomorphic rod
- highly contagious; transmitted via respiratory droplets released during intense coughing
- incubation period: 6-20 d; most contagious during catarrhal phase but may remain contagious for weeks after

**History**

- prodromal catarrhal stage
  - lasts 1-7 d; URTI symptoms (coryza, mild cough, sneezing) with NO or LOW-GRADE fever
- paroxysmal stage
  - lasts 4-6 wk; characterized by paroxysms of cough (“100 day cough”), sometimes followed by inspiratory whoop (“whooping cough”)
  - infants <6 mo may present with post-tussive apnea, whoop is often absent
  - onset of attacks precipitated by yawning, sneezing, eating, physical exertion
  - ± post-tussive emesis, may become cyanotic before whoop
- convalescent stage
  - lasts 1-2 wk; characterized by occasional paroxysms of cough, but decreased frequency and severity
  - non-infectious but cough may last up to 6 mo

**Investigations**

- nasopharyngeal (NP) specimen using aspirate or NP swab
  - gold standard: culture using special media (Regan-Lowe agar)
  - PCR to detect pertussis antigens
- blood work: CBC (lymphocytosis) and serology (antibodies against *B. pertussis*)

**Management**

- admit if paroxysms of cough are associated with cyanosis and/or apnea and give O<sub>2</sub>
- supportive care
- antimicrobial therapy indicated if *B. pertussis* isolated, or symptoms present for <21 d
  - use macrolide antibiotics (azithromycin, erythromycin or clarithromycin)
- droplet isolation until 5 d of treatment
  - report to public health

- prophylaxis
  - macrolide antibiotics for all household contacts
  - prevention with vaccination in infants and children (Pentacel®), and booster in adolescents (Adacel®) (see *Routine Immunization*, P3)

### Complications

- pressure related from paroxysms: subconjunctival hemorrhage, rectal prolapse, hernias, epistaxis
- respiratory: sinusitis, pneumonia, aspiration, atelectasis, pneumomediastinum, pneumothorax, alveolar rupture
- neurological: seizures (~3%), encephalopathy, intracranial hemorrhage
- mortality: ~0.3%; highest risk in infants <6 mo old

## Pneumonia

- see P93

## Periorbital (Preseptal) and Orbital Cellulitis

- see [Ophthalmology](#), OP10
- preseptal cellulitis ~3 times more common than orbital cellulitis
- causative pathogens include: *S. aureus*, *S. pyogenes*, *S. pneumoniae*, *M. catarrhalis*, *H. influenzae* (less common now due to vaccination)
- key to management is distinguishing between preseptal and orbital cellulitis (which is an OCULAR and MEDICAL EMERGENCY)

### Cardinal Signs of Orbital Involvement

- Ophthalmoplegia/diplopia
- Decreased visual acuity
- Pain with extraocular eye movement

## Sexually Transmitted Infection

- see [Family Medicine](#), FM46 and [Gynecology](#), GY26

## Sinusitis

- see [Family Medicine](#), FM47
- complication of ≤10% of URTIs in children
- clinical diagnosis
- diagnostic imaging is NOT required to confirm diagnosis in children
  - routine CT not recommended, but consider if suspect complications of sinusitis, persistent/recurrent disease, need for surgery
- antibiotic therapy for all children (although nearly half resolve spontaneously within 4 wk)
- complications: preseptal/orbital (cellulitis, orbital abscess, osteomyelitis, etc.), intracranial (meningitis, abscess, etc.), Pott's Puffy tumour

## Urinary Tract Infection (UTI)

### Definition

- infection of the urinary bladder (cystitis) and/or kidneys (pyelonephritis)

### Epidemiology

- overall prevalence in infants and young children presenting with fever is 7%
- <4-6 wk old: more common in boys
- >1 yr old: females have two to four fold higher prevalence

### Etiology

- majority (>95%) have a monomicrobial cause with *E. coli* identified as the causative agent most of the time (~70%)
- Gram-negative bacilli: *E. coli*, *Klebsiella*, *Proteus*, *Enterobacter*, *Pseudomonas*
- Gram-positive cocci: *S. saprophyticus*, *Enterococcus*

### Risk Factors

- non-modifiable: female gender, Caucasian, previous UTIs, family history
- modifiable: urinary tract abnormalities (vesicoureteral reflux, neurogenic bladder, obstructive uropathy, posterior urethral valve), dysfunctional voiding, repeated bladder catheterization, uncircumcised males, labial adhesions, sexually active, constipation, toilet training

Bagged urine specimen not useful for ruling in UTI (high false positive rate >85%), but useful for ruling out UTI (high sensitivity).

### Features suggestive of pyelonephritis

- High-grade fever
- Flank or high abdominal pain
- CVA tenderness on palpation

## History

- infants and young child: often just fever or non-specific symptoms (poor feeding, irritability, FTT, jaundice if <28 d old, vomiting)
- older child: fever, urinary symptoms (dysuria, urgency, frequency, incontinence, hematuria), abdominal and/or flank pain

## Physical

- infants and young child: toxic vs non-toxic, febrile, FTT, jaundice; look for external genitalia abnormalities (phimosis, labial adhesions) and lower back signs of occult myelodysplasia (e.g. hair tufts), which may be associated with neurogenic bladder
- older child: febrile, suprapubic and/or CVA tenderness, abdominal mass (enlarged bladder or kidney); may present with short stature, FTT or hypertension secondary to renal scarring from previously unrecognized or recurrent UTIs

## Investigations

- sterile urine specimen
  - clean catch, catheterization or suprapubic aspiration
  - urinalysis (leukocyte esterase, nitrites, erythrocytes), microscopy (bacteria and leukocytes), culture and sensitivity
- diagnosis established if urinalysis suggests infection AND if  $\geq 50,000$  colony-forming units per mL of a uropathogen cultured

## Management

- admit if: <2 mo old, urosepsis, persistent vomiting, inability to tolerate oral medication, moderate-severe dehydration, immunocompromised, complex urologic pathology, inadequate follow-up, failure to respond to outpatient therapy
- supportive care: maintenance of hydration and adequate pain control
- antibiotics
  - base on local antimicrobial susceptibility patterns
  - commence broad empiric therapy until results of urine culture and sensitivity known, and then tailor as appropriate
  - neonates: IV ampicillin and gentamicin
  - infants and older children: oral cephalexin if outpatient; IV ampicillin and gentamicin if inpatient
  - duration 7-14 d
- imaging
  - renal and bladder U/S for all febrile infants with UTIs looking for anatomical abnormalities, hydronephrosis, abscess
  - voiding cystourethrogram (VCUG) not recommended after 1st febrile UTI unless U/S reveals hydronephrosis, obstructive uropathies or other signs suggestive of high-grade vesicoureteral reflux (VUR)
- follow-up: outpatients to return in 24-48 h if no clinical response and seek prompt medical evaluation for future febrile illnesses
- prophylaxis: generally not recommended unless higher grades of VUR

## Complications

- long term morbidity: focal renal scarring develops in 8% of patients; long term significance unknown

### Sensitivity and Specificity of Urine Dip in Children

	Sensitivity	Specificity
Microscopy	73%	81%
Leukocytes		
Nitrites	53%	98%
Leukocyte esterase	83%	78%
Microscopy	81%	83%
Bacteriuria		
Leukocyte esterase, or nitrites, or microscopy positive	99.8%	70%

*Pediatrics* 2011;128:595-610

### Prophylaxis After First Febrile Urinary Tract Infection in Children? A Multicenter, Randomized Controlled, Noninferiority Trial

*Pediatrics* 2008;122:1064-1071

**Study:** Randomized, controlled, open-label, 2 armed, noninferiority trial.

**Patients:** 338 patients aged 2 mo to <7 yr who had a first episode of febrile UTI.

**Intervention:** No prophylaxis vs. prophylaxis

**Outcome:** Recurrence rate of febrile UTI and rate of renal scarring.

**Results:** No significant difference in recurrence rate or in the rate of renal scarring between the prophylaxis and no prophylaxis group.

### Dubowitz/Ballard Scores

GA can be determined after birth using Dubowitz/Ballard scores:

- Assessment at delivery of physical maturity (e.g. plantar creases, lanugo, ear maturation) and neuromuscular-maturity (e.g. posture, arm recoil) translates into a score from -10 to +50
- Higher score means greater maturity (increased GA)
- -10 = 20 wk; +50 = 44 wk
- Ideal = 35-40 which corresponds to GA 38-40 wk
- Only accurate  $\pm 2$  wk

# Neonatology

## Gestational Age (GA) and Size

### Definitions

- classification by gestational age (GA)
  - preterm: <37 wk
  - term: 37-42 wk
  - post-term: >42 wk
- classification by birth weight
  - small for gestational age (SGA): 2 SD < mean weight for GA or <10<sup>th</sup> percentile
  - appropriate for gestational age (AGA): within 2 SD of mean weight for GA
  - large for gestational age (LGA): 2 SD > mean weight for GA or >90<sup>th</sup> percentile

**Table 26. Abnormalities of Gestational Age and Size**

Features	Causes	Problems
<b>Pre-term Infants</b> <37 wk	Spontaneous: cause unknown Maternal disease: hypertension, diabetes, cardiac and renal disorders Fetal conditions: multiple pregnancy, congenital abnormalities Pregnancy issues: placental insufficiency, placenta praevia, uterine malformations, previous preterm birth, infection Behavioural and psychological contributors: smoking, EtOH, drug use, psychosocial stressors Sociodemographic factors: age, socioeconomic conditions	Respiratory distress syndrome, apnea of prematurity, chronic lung disease, bronchopulmonary dysplasia Feeding difficulties, necrotizing enterocolitis (NEC) Hypocalcemia, hypoglycemia, hypothermia Anemia, jaundice Retinopathy of prematurity Intracranial/intraventricular hemorrhage Patent ductus arteriosus (PDA)
<b>Post-term Infants</b> >42 wk Leathery skin Meconium staining	Most cases unknown Increased in first pregnancies Previous post-term birth Genetic factors	Increased risk of stillbirth or neonatal death Increased birthweight Fetal "postmaturity syndrome": impaired growth due to placental dysfunction Meconium aspiration
<b>SGA Infants</b> <10 <sup>th</sup> percentile Asymmetric (head-sparing): late onset, growth arrest	Extrinsic causes: placental insufficiency, poor nutrition, hypertension, multiple pregnancies, drugs, EtOH, smoking	Perinatal hypoxia Hypoglycemia, hypocalcemia, hypothermia, hyperviscosity (polycythemia), jaundice, hypomotility
Symmetric: early onset, lower growth	Intrinsic causes: maternal infections (TORCH), congenital abnormalities, syndromal, idiopathic	Patent ductus arteriosus (PDA)
<b>LGA Infants</b> >90 <sup>th</sup> percentile	Maternal diabetes Racial or familial factors Increasing parity Previous LGA infant, high BMI, large pregnancy weight gain Certain syndromes	Birth trauma, perinatal depression (meconium aspiration, respiratory distress syndrome (infants of diabetic mothers), transient tachypnea of newborn, jaundice, polycythemia, hypoglycemia, hypocalcemia)

## Routine Neonatal Care

- erythromycin ointment: applied to both eyes for prophylaxis of ophthalmia neonatorum
- vitamin K IM: prophylaxis against hemorrhagic disease of newborn
- screening tests
  - in Ontario, newborn screening tests for
    - hearing loss
    - endocrine disorders (congenital adrenal hyperplasia, congenital hypothyroidism)
    - cystic fibrosis
    - hemoglobinopathies (HbSS, HbSc, etc.)
    - inborn errors of metabolism including galactosemia, biotinidase deficiency, fatty acid oxidation defects
- if mother Rh negative: send cord blood for blood group and direct antiglobulin test
- if mother hepatitis B surface antigen positive: HBIG and start hepatitis B vaccine series

## Neonatal Resuscitation

- assess Apgar at 1 and 5 min
- if <7 at 5 min then reassess q5min, until >7
- do not wait to assign Apgar score before initiating resuscitation

**Table 27. Apgar Score**

Sign	0	1	2
<b>Heart Rate</b>	Absent	<100/min	>100/min
<b>Respiratory Effort</b>	Absent	Slow, irregular	Good, crying
<b>Irritability</b>	No response	Grimace	Cough/cry
<b>Tone</b>	Limp	Some flexion of extremities	Active motion
<b>Colour</b>	Blue, pale	Body pink, extremities blue (acrocyanosis)	Completely pink

### Apgar Score

Appearance (colour)  
Pulse (heart rate)  
Grimace (irritability)  
Activity (tone)  
Respiration (respiratory effort)  
Or: "How Ready Is This Child?"

### Initial Resuscitation

- anticipation: know maternal history, history of pregnancy, labour, and delivery
- steps to take for all infants (before ABCs)
  - warm (radiant heater, warm towels) and dry the newborn (remove wet towels)
  - position and clear airway (“sniffing” position)
  - stimulate infant: rub lower back gently or flick soles of feet EXCEPT if meconium present (in which case tracheal suction first)
  - assess breathing and heart rate
- Airway
  - if meconium is present and
    - ♦ baby is vigorous (strong respiratory effort, good muscle tone, HR >100): no further resuscitative interventions required
    - ♦ baby is not vigorous: intubate and suction trachea while monitoring vital signs. If prolonged or unsuccessful intubation, attempt bag mask ventilation
  - if no meconium and suction required, suction mouth first and then nose
- Breathing
  - if HR <100 or apnoeic, apply positive pressure ventilation (PPV)
  - PPV at rate of 40-60/min with enough pressure to see visible chest expansion and note increase in HR
  - if PPV not effective (no increase in HR, no chest rise), incorporate MRSOPA corrective actions
- Circulation
  - if HR <60 after 30 s of effective ventilation, start chest compressions (“60 or less, compress”)
  - should provide 100% oxygen as soon as chest compressions are required
  - chest compressions at lower 1/3 of the sternum and 1/3 of the AP depth at a rate of 120 events per min (3 compressions:1 ventilation = 90 compressions/min:30 breaths/min)

#### MR SOPA

Mask readjustment  
Reposition airway  
Suction mouth and nose  
Open mouth  
Pressure increase  
Alternative airway

**Table 28. Interventions Used in Neonatal Resuscitation**

Intervention	Schedule	Indications	Comments
<b>Epinephrine</b> (adrenalin)	0.1-0.3 mL/kg/dose of 1:10,000 (0.01-0.03 mg/kg) IV 0.05-0.1 mg/kg (0.5-1 mL/kg 1:10,000) endotracheally can be considered while awaiting IV access (IV preferred) Can be repeated q3-5 min prn	HR <60 and not rising	Side effects: tachycardia, hypertension, cardiac arrhythmias
<b>Naloxone</b> (Narcan®)	0.1 mg/kg IV/IM	Not recommended as part of initial resuscitation. HR and oxygenation should be restored by supporting ventilation	Do not use for chronic opiate exposure – may cause withdrawal symptoms including hypertension, irritability, seizures Action of opioid outlasts action of naloxone therefore close monitoring required after administration
<b>Fluid Bolus</b> (NS, whole blood, Ringer's lactate)	10 mL/kg May need to be repeated Not to give too rapidly as large volume rapid infusions can be associated with IVH	Evidence of hypovolemia	

## Approach to the Depressed Newborn

- a depressed newborn lacks one or more of the following characteristics of a normal newborn
  - pulse >100 bpm
  - cries when stimulated
  - actively moves all extremities
  - has a good strong cry
- approximately 10% of newborn babies require assistance with breathing after delivery

**Table 29. Etiology of Respiratory Depression in the Newborn**

Etiology	Examples
<b>Respiratory Problems</b>	Respiratory distress syndrome/Hyaline membrane disease Pulmonary hypoplasia CNS depression Meconium aspiration Pneumonia Pneumothorax Pleural effusions Congenital malformations

**Table 29. Etiology of Respiratory Depression in the Newborn** (continued)

Etiology	Examples
Anemia (severe)	Erythroblastosis fetalis Secondary hydrops fetalis
Maternal Causes	Drugs/anesthesia (opiates, mag sulphate) Diabetes mellitus Maternal myasthenia gravis
Congenital Malformations/Birth Injury	Nuchal cord, perinatal depression Bilateral phrenic nerve injury Potter's sequence
Shock	Antepartum hemorrhage
Congenital Heart Disease	Transposition of the great arteries with intact ventricular septum
Other	Hypothermia Hypoglycemia Infection

**Diagnosis**

- vital signs
- detailed maternal history
  - include prenatal care, illnesses, use of drugs, labour, previous high risk pregnancies, infections during pregnancy, current infections, duration of ruptured membranes, blood type and Rh status, amniotic fluid status, gestational age, meconium, Apgar scores
- clinical findings (observe for signs of respiratory distress: cyanosis, tachypnea, retractions, grunting, temperature instability)
- laboratory results (CBC, ABG, blood type, glucose)
- transillumination
- CXR

**Management**

- ABCs
- intubation and suction if meconium present
- apply tactile stimulation if no meconium
- provide PPV if apneic or HR <100 bpm
- monitor oxygen saturation and heart rate (if HR <60 bpm, start chest compressions)
- provide ventilatory support and treat the underlying cause

## Common Conditions of Neonates

### Apnea

**Definition**

- “periodic breathing”: normal respiratory pattern seen in newborns in which periods of rapid respiration are alternated with pauses lasting 5-10 s
- “apnea”: absence of respiratory gas flow for >15 s (or less if associated with bradycardia or desaturation) – 3 types:
  - central: no chest wall movement, no signs of obstruction
  - obstructive: chest wall movement continues against obstructed upper airway, no airflow
  - mixed: combination of central and obstructive apnea

**Differential Diagnosis**

- in term infants, apnea requires full work-up as it can be associated with sepsis
- other causes:
  - CNS
    - ♦ apnea of prematurity (<34 wk): combination of CNS immaturity and obstructive apnea; resolves by 36 wk GA; diagnosis of exclusion
    - ♦ seizures
    - ♦ intracranial hemorrhage (ICH)
    - ♦ hypoxic injury
  - infectious: sepsis, meningitis, necrotizing enterocolitis (NEC)
  - GI: gastroesophageal reflux disease (GERD), aspiration with feeding
  - metabolic: hypoglycemia, hyponatremia, hypocalcemia, IEM
  - cardiovascular: anemia, hypovolemia, PDA, heart failure
  - drugs: morphine

**Management**

- O<sub>2</sub>, ventilatory support, maintain normal blood gases
- tactile stimulation
- correct underlying cause
- medications: methylxanthines (caffeine) stimulate the CNS and diaphragm and are used for apnea of prematurity (not in term infants)

## Bleeding Disorders in Neonates

**Clinical Presentation**

- oozing from the umbilical stump, excessive bleeding from peripheral venipuncture/heel stick sites/IV sites, large caput succedaneum, cephalohematomas (in absence of significant birth trauma), subgaleal haemorrhage and prolonged bleeding following circumcision

**Approach to Bleeding Disorders in Neonates**

- 4 major categories

**1. increased platelet destruction:**

- maternal ITP, SLE
- neonatal alloimmune thrombocytopenia (NAIT)
- infection
- DIC
- drugs
- extensive localized thrombosis

**2. decreased platelet production/function:**

- bone marrow replacement
- pancytopenia
- Fanconi anemia
- Trisomy 13 and 18

**3. metabolic:**

- congenital thyrotoxicosis
- inborn error of metabolism

**4. coagulation factor deficiencies (see [Hematology](#), H29):**

- hemophilia A
- hemophilia B
- hemorrhagic disease of the newborn

### NEONATAL ALLOIMMUNE THROMBOCYTOPENIA (NAIT)

**Epidemiology**

- 1 per 4000-5000 live births

**Pathophysiology**

- platelet equivalent of Rh disease of the newborn
- occurs when mother is negative for human platelet antigen (HPA) and fetus is positive
- development of maternal IgG antibodies against HPA antigens on fetal platelets

**Clinical Presentation**

- petechiae, purpura, thrombocytopenia in otherwise healthy neonate
- severe NAIT can lead to intracranial bleeding

**Diagnosis**

- maternal and paternal platelet typing and identification of platelet alloantibodies

**Treatment**

- IVIG to mother prenatally starts in second trimester ± steroids ± fetal platelet transfusions
- treat neonate with IVIG
- if transfusion required should be with washed maternal platelets or donor HPA negative platelets

### AUTOIMMUNE THROMBOCYTOPENIA

**Pathophysiology**

- caused by antiplatelet antibodies from maternal ITP or SLE
- passive transfer of antibodies across placenta

**Clinical Presentation**

- similar presentation to NAIT, but thrombocytopenia usually less severe

**Treatment**

- steroids to mother for 10-14 d prior to delivery or IVIG to mother before delivery
- IVIG infant after delivery (usually if platelets <60,000)
- transfusion of infant with maternal/donor platelets only in severe cases, as antibodies will destroy transfused platelets

**HEMORRHAGIC DISEASE OF THE NEWBORN**

- caused by vitamin K deficiency
- factors II, VII, IX, X are vitamin K-dependent, therefore both PT and PTT are abnormal

**Etiology and Clinical Presentation**

- neonates at risk of vitamin K deficiency if:
  - vitamin K poorly transferred across the placenta
  - maternal use of anticonvulsants
  - insufficient bacterial colonization of colon at birth to synthesize vitamin K
  - dietary intake of vitamin K inadequate in breastfed infants

**Prevention**

- vitamin K IM administration at birth to all newborns

**Bronchopulmonary Dysplasia (BPD)****Definition**

- also known as chronic lung disease (CLD)
- clinically defined as O<sub>2</sub> requirement for >28 d plus persistent need for oxygen and/or ventilatory support at 36 wk corrected GA
- damage to developing lungs with prolonged intubation/ventilation

**Investigations**

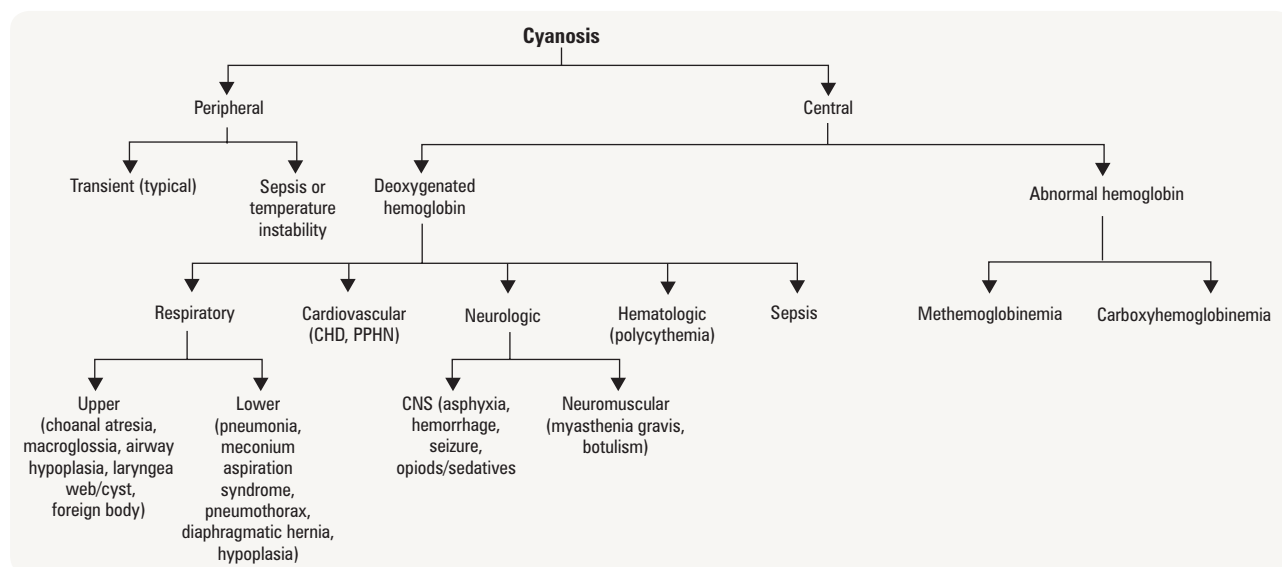

- CXR findings may demonstrate decreased lung volumes, areas of atelectasis and hyperinflation

**Treatment**

- no good treatments
- gradual wean from ventilator, optimize nutrition
- dexamethasone may help decrease inflammation and encourage weaning, but use of dexamethasone is associated with increased risk of adverse neurodevelopmental outcomes

**Prognosis**

- chronic respiratory failure may lead to pulmonary hypertension, poor growth, and right-sided heart failure
- patients with BPD may continue to have significant impairment and deterioration in lung function late into adolescence
- some lung abnormalities may persist into adulthood including airway obstruction, airway hyper-reactivity, and emphysema
- associated with increased risk of adverse neurodevelopmental outcomes

**Cyanosis****Figure 12. Approach to neonatal cyanosis**

## Management

- ABGs
  - elevated  $\text{CO}_2$  suggests respiratory cause
  - hyperoxia test (to distinguish between cardiac and respiratory causes of cyanosis): get baseline  $\text{PaO}_2$  in room air, then  $\text{PaO}_2$  on 100%  $\text{O}_2$  for 10-15 min
    - ♦  $\text{PaO}_2 < 150$  mmHg: suggests cyanotic congenital heart disease or possible persistent newborn pulmonary hypertension (PPHN) (see *Pediatric Cardiology*, P16)
    - ♦  $\text{pO}_2 > 150$  mmHg: suggests cyanosis likely due to respiratory or non-cardiac cause
- CXR: look for respiratory abnormalities (respiratory tract malformations, evidence of shunting, pulmonary infiltrates) and cardiac abnormalities (cardiomegaly, abnormalities of the great vessels)

**Carboxyhemoglobinemia** (secondary to carbon monoxide poisoning) results in impaired binding of oxygen to hemoglobin but does not discolour the blood. Therefore it may not register on pulse-oximetry and cyanosis may not be evident clinically.

**Methemoglobinemia** pulse oximetry typically reads higher than the true level of oxyhemoglobin. Methemoglobin alters the absorption of red light at the two wavelengths that pulse oximetry uses to predict oxygen saturation.

## Diaphragmatic Hernia

### Definition

- developmental defect of the diaphragm with herniation of abdominal organs into thorax
- associated with pulmonary hypoplasia and PPHN

### Clinical Presentation

- respiratory distress, cyanosis
- scaphoid abdomen and barrel-shaped chest
- affected side dull to percussion and breath sounds absent, may hear bowel sounds instead
- heart sounds shifted to contralateral side
- asymmetric chest movements, trachea deviated away from affected side
- may present outside of neonatal period
- often associated with other anomalies (cardiovascular, CNS, chromosomal abnormalities)
- CXR: bowel loops in thorax (usually left side), displaced mediastinum

### Treatment

- immediate intubation required at birth: DO NOT bag mask ventilate because air will enter stomach and further compress lungs
- place large bore orogastric tube to decompress bowel
- initial stabilization and management of pulmonary hypoplasia and PPHN, hemodynamic support and surgery when stable

## Hypoglycemia

### Definition

- glucose  $< 2.6$  mmol/L (40 mg/dL)

### Etiology

- decreased carbohydrate stores (premature, IUGR)
- infant of a diabetic mother (IDM): maternal hyperglycemia  $\rightarrow$  fetal hyperglycemia and hyperinsulinism  $\rightarrow$  hypoglycemia in the newborn infant because of high insulin levels
- sepsis
- hyperinsulinism due to islet cell hyperplasia (e.g. Beckwith-Wiedemann syndrome)
- panhypopituitarism
- inborn errors of metabolism: fatty acid oxidation defects, galactosemia

### Clinical Findings

- signs often non-specific and subtle: lethargy, poor feeding, irritability, tremors, apnea, cyanosis, seizures

### Management

- identify and monitor infants at risk (pre-feed blood glucose checks)
- begin oral feeds as soon as possible after birth and ensure regular feeds
- if significant and/or symptomatic hypoglycemia, provide glucose IV and titrate according to blood sugar levels
- if persistent hypoglycemia or no predisposing cause for hypoglycemia, send "critical bloodwork" during an episode of hypoglycemia:
 

▪ insulin	▪ lactate
▪ cortisol	▪ ammonia
▪ growth hormone (GH)	▪ free fatty acids (FFAs)
▪ $\beta$ -hydroxybutyrate	▪ ABG
- hyperinsulinism managed with glucagon and/or diazoxide, consultation with pediatric endocrinologist

## Intraventricular Hemorrhage (IVH)

### Definition

- hemorrhage originating in the periventricular subependymal germinal matrix (GM)

### Epidemiology

- incidence and severity inversely proportional to gestational age
- 50% of IVH occurs within 8 h of birth; 90% occurs by day 3

### Risk Factors

- prematurity (<32 wk), BW <1500 g, need for vigorous resuscitation at birth, pneumothorax, ventilated preterm infants, hemodynamic instability, RDS, coagulopathy

### Clinical Presentation

- many infants with IVH are asymptomatic
- subtle signs: apnea, bradycardia, changes in tone or activity, altered level of consciousness
- catastrophic presentation: bulging fontanelle, sudden drop in hematocrit, acidosis, seizures, hypotension

### Classification

- Papile classification
- parenchymal hemorrhage may also occur in the absence of intraventricular hemorrhage
- routine head ultrasound screening of all preterm infants <32 wk or <1500 g gestation throughout NICU stay

### Management of Acute Hemorrhage

- supportive care to maintain blood volume and acid-base status
- avoid fluctuations in blood pressure and cerebral blood flow
- follow-up with serial imaging

### Prognosis

- outcome depends on grade of IVH
- short-term sequelae for severe IVH: mortality, extension of bleed, posthemorrhagic hydrocephalus (PHH), posthemorrhagic infarction, cyst formation
- possible long-term major neurological sequelae: cerebral palsy, cognitive deficits, motor deficits, visual and hearing impairment
- grades I and II hemorrhages have a relatively favourable prognosis
- greatest morbidity and mortality is seen with Grade IV hemorrhage and PHH requiring ventriculoperitoneal shunt placement

#### Papile Classification

Grade I: GM hemorrhage  
Grade II: IVH without ventricular dilatation  
Grade III: IVH with ventricular dilatation  
Grade IV: IVH with parenchymal extension

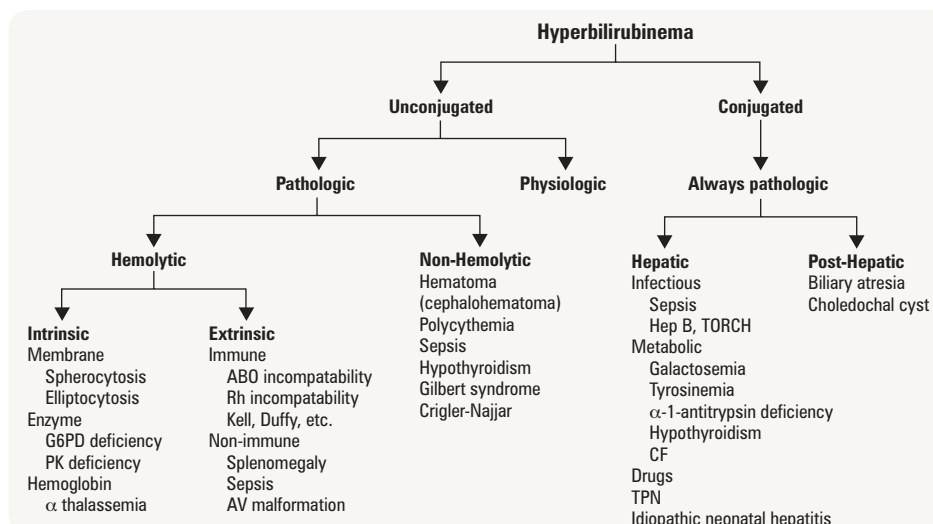

## Jaundice

### Clinical Presentation

- jaundice is visible at serum bilirubin levels of 85-120  $\mu\text{mol/L}$
- look at sclera, tip of nose in natural light
- jaundice more severe/prolonged (due to increased retention of bilirubin in the circulation) with:
  - prematurity, acidosis, hypoalbuminemia, dehydration

Jaundice is very common – 60% of term newborns develop visible jaundice.

Jaundice in the first 24 h and conjugated hyperbilirubinemia are always pathological.

Figure 13. Approach to neonatal hyperbilirubinemia

## PHYSIOLOGIC JAUNDICE

### Epidemiology

- term infants: onset 2-3 d of life, resolution by 7 d of life
- premature infants: higher peak and longer duration

### Pathophysiology

- increased hematocrit and decreased RBC lifespan
- immature glucuronyl transferase enzyme system (slow conjugation of bilirubin)
- increased enterohepatic circulation

**Table 30. Risk Factors for Jaundice**

Maternal Factors	Perinatal Factors	Neonatal Factors
Ethnic group (e.g. Asian, native American) Complications during pregnancy (infant of diabetic mother, Rh or ABO incompatibility) Breastfeeding	Birth trauma (cephalohematoma, ecchymoses) Prematurity	Difficulty establishing breastfeeding Infection Genetic factors Polycythemia Drugs

**Table 31. Causes of Neonatal Jaundice by Age**

<24 h	24-72 h	72-96 h	Prolonged (>1 wk)
<b>ALWAYS PATHOLOGIC</b> Hemolytic Rh or ABO incompatibility Sepsis, e.g. GBS Congenital infection (TORCH) Severe bruising/hemorrhage	Physiologic, polycythemia Dehydration (breastfeeding jaundice) Hemolysis G6PD deficiency Pyruvate kinase deficiency Spherocytosis Bruising, hemorrhage, hematoma Sepsis/congenital infection	Physiologic ± breastfeeding Sepsis	Breast milk jaundice Prolonged physiologic jaundice in preterm Hypothyroidism Neonatal hepatitis Conjugation dysfunction e.g. Gilbert syndrome, Crigler-Najjar syndrome Inborn errors of metabolism e.g. galactosemia Biliary tract obstruction e.g. biliary atresia

### Breastfeeding Jaundice

- common; due to a lack of milk production → dehydration → exaggerated physiologic jaundice

### Breast Milk Jaundice

- 1 per 200 breastfed infants
- glucuronyl transferase inhibitor found in breast milk
- onset 7 d of life, peak at 2-3 wk of life, usually resolved by 6 wk

## PATHOLOGIC JAUNDICE

- must be investigated if:
  - jaundice at <24 h of age
  - serum unconjugated bilirubin rises rapidly or is excessive for patient's age and weight
  - conjugated hyperbilirubinemia
  - persistent jaundice lasting beyond 1-2 wk of age
- investigations
  - unconjugated hyperbilirubinemia:
    - ♦ hemolytic work-up: CBC, reticulocyte count, blood group (mother and infant), peripheral blood smear, Coombs test, bilirubin (conjugated, unconjugated)
    - ♦ if baby is unwell or has fever: septic work-up (CBC and differential, blood and urine cultures ± LP, CXR)
    - ♦ other: G6PD screen (in males), TSH
  - conjugated hyperbilirubinemia: consider liver enzymes (AST, ALT), coagulation studies (PT, PTT), serum albumin, ammonia, TSH, TORCH screen, septic work-up, galactosemia screen (erythrocyte galactose-1-phosphate uridylyltransferase levels), metabolic screen, abdominal U/S, HIDA scan, sweat chloride

### "Bronzed" Baby in Infants with Conjugated Hyperbilirubinemia

Phototherapy results in the production and accumulation of a toxic metabolite which also imparts a bronze hue on the baby's skin.

## TREATMENT OF UNCONJUGATED HYPERBILIRUBINEMIA

- to prevent kernicterus (see P75)
- breastfeeding does not need to be discontinued, ensure adequate feeds and hydration
- lactation consultant support, mother to pump after feeds
- treat underlying causes (e.g. sepsis)
- phototherapy
  - insoluble unconjugated bilirubin is converted to excretable form via photoisomerization
  - serum bilirubin should be monitored during and immediately after therapy (risk of rebound because photoisomerization reversible when phototherapy discontinued)

- contraindicated in conjugated hyperbilirubinemia: results in “bronzed” baby
- side effects: skin rash, diarrhea, eye damage
- use published guidelines for initiation of phototherapy
- exchange transfusion
  - indications: high bilirubin levels as per published graphs based on age, weeks gestation
  - most commonly performed for hemolytic disease and G6PD deficiency

## KERNICTERUS

### Etiology

- unconjugated bilirubin concentrations exceed albumin binding capacity and bilirubin is deposited in the brain resulting in permanent damage (typically basal ganglia or brainstem)
- incidence increases as serum bilirubin levels increase above 340  $\mu\text{mol/L}$  (19.8 mg/dL)
- can occur at lower levels in presence of sepsis, meningitis, hemolysis, hypoxia, acidosis, hypothermia, hypoglycemia and prematurity

### Clinical Presentation

- up to 15% of infants have no obvious neurologic symptoms
- early stage: lethargy, hypotonia, poor feeding, emesis
- mid stage: hypertonia, high pitched cry, opisthotonic posturing (back arching), bulging fontanelle, seizures, pulmonary hemorrhage
- late stage (first year and beyond)
  - hypotonia, delayed motor skills, extrapyramidal abnormalities (choreoathetoid cerebral palsy), gaze palsy, mitral regurgitation, sensorineural hearing loss

### Prevention

- exchange transfusion

### Complications

- sensorineural deafness, choreoathetoid cerebral palsy (CP), gaze palsy, mental retardation

## BILIARY ATRESIA

### Definition

- atresia of the extrahepatic bile ducts which leads to cholestasis and increased conjugated bilirubin after the first week of life

### Epidemiology

- incidence: 1:10,000-15,000 live births

### Clinical Presentation

- dark urine, pale stool, jaundice (persisting for >2 wk), abdominal distension, hepatomegaly

### Diagnosis

- conjugated hyperbilirubinemia, abdominal ultrasound
- HIDA scan
- liver biopsy

### Treatment

- surgical drainage procedure
- hepatoportoenterostomy (Kasai procedure; most successful if <8 wk of age)
- usually requires liver transplantation
- vitamins A, D, E, and K; diet should be enriched with medium-chain triglycerides to ensure adequate fat ingestion

## Necrotizing Enterocolitis (NEC)

### Definition

- intestinal inflammation associated with focal or diffuse ulceration and necrosis
- primarily affecting terminal ileum and colon

### Epidemiology

- affects 1-5% of preterm newborns admitted to NICU

### Pathophysiology

- postulated mechanism of bowel ischemia: mucosal damage and enteral feeding → bacterial growth → bowel necrosis/gangrene/perforation

**Risk Factors**

- prematurity (immature defenses)
- asphyxia, shock (poor bowel perfusion)
- hyperosmolar feeds
- enteral feeding with formula (breast milk can be protective)
- sepsis

**Clinical Presentation**

- distended abdomen
- increased amount of gastric aspirate/vomitus with bile staining
- frank or occult blood in stool
- feeding intolerance
- diminished bowel sounds
- signs of bowel perforation (sepsis, shock, peritonitis, DIC)

**Investigations**

- AXR: pneumonitis intestinalis (intramural air is a hallmark of NEC), free air, fixed loops, ileus, thickened bowel wall, portal venous gas
- CBC, ABG, lactate, blood culture, electrolytes
- high or low WBC, low platelets, hyponatremia, acidosis, hypoxia, hypercapnea

**Treatment**

- NPO (7-10 d), vigorous IV fluid resuscitation, decompression with NG tube, supportive therapy
- TPN
- antibiotics (usually ampicillin, gentamicin ± metronidazole if risk of perforation x 7-10 d)
- serial AXRs detect early perforation
- peritoneal drain/surgery if perforation
- surgical resection of necrotic bowel and surgery for complications (e.g. perforation, strictures)

**Role of Human Milk in Extremely Low Birth Weight Infants' Risk of Necrotizing Enterocolitis or Death**

*J Perinatol* 2009;29:57-62

**Purpose:** To determine if human milk (HM) intake is related to decreased risk of NEC or death.

**Study:** An association between proportion of HM to total intake (enteral and parenteral), enteral intake alone and total volume during the first 14 d after birth to NEC and death was evaluated.

**Patients:** 1272 infants with a birth weight between 401 to 1000 g.

**Main Outcome:** NEC or death occurring between 14 d after birth to 120 d or hospital discharge.

**Results:** For each 10% increase in the proportion of HM to total intake, there was a decrease in likelihood of NEC or death (HR 0.83, 95% CI 0.72 – 0.96). Infants who developed NEC or died were more likely to receive parenteral nutrition only compared to infants who did not develop NEC or death (19 vs. 7.8%).

**Summary:** A reduction in the risk of NEC or death among extremely low birth weight infants was associated with HM feeding. A possible dose-dependent beneficial effect of HM is suggested in extremely low birth weight infants.

## Persistent Pulmonary Hypertension of the Newborn (PPHN)

**Epidemiology**

- incidence 1.9 per 1000 live births

**Clinical Presentation**

- usually presents within 12 h of birth with severe hypoxemia/cyanosis; may have only mild respiratory distress

**Pathophysiology**

- persistence of fetal circulation as a result of persistent elevation of pulmonary vascular resistance
- R → L shunt through PDA, foramen ovale → decreased pulmonary blood flow and hypoxemia → further pulmonary vasoconstriction

**Risk Factors**

- secondary PPHN: asphyxia, meconium aspiration syndrome (MAS), respiratory distress syndrome (RDS), sepsis, pneumonia, structural abnormalities (e.g. diaphragmatic hernia, pulmonary hypoplasia)
- primary PPHN occurs in absence of risk factors

**Investigations**

- measure pre- and post-ductal oxygen levels
- ECHO reveals increased pulmonary arterial pressure and a R → L shunt across PDA and PFO; also used to rule out other cardiac defects

**Treatment**

- maintain good oxygenation (SaO<sub>2</sub> >95%) in at-risk infants
- O<sub>2</sub> given early and tapered slowly, minimize stress and metabolic demands, maintain normal blood gases, circulatory support
- mechanical ventilation, high frequency oscillation (HFO)
- nitric oxide
- extracorporeal membrane oxygenation (ECMO) used in some centres when other therapy fails

## Respiratory Distress in the Newborn

**Clinical Presentation**

- tachypnea: RR >60/min; tachycardia: HR >160/min
- grunting, subcostal/intercostal indrawing, nasal flaring
- dusky skin, central cyanosis
- decreased air entry, crackles on auscultation

## Differential Diagnosis of Respiratory Distress

- pulmonary
  - respiratory distress syndrome (RDS)
  - transient tachypnea of the newborn (TTN)
  - meconium aspiration syndrome (MAS)
  - pleural effusions, pneumothorax
  - congenital lung malformations
- infectious
  - sepsis, pneumonia
- cardiac
  - congenital heart disease (cyanotic, acyanotic)
  - persistent pulmonary hypertension of the newborn (PPHN)
- hematologic
  - blood loss, polycythemia
- anatomic
  - tracheoesophageal fistula
  - congenital diaphragmatic hernia
  - upper airway obstruction (see [Otolaryngology](#), OT44)
    - ♦ choanal atresia
    - ♦ Pierre-Robin sequence (retrognathia ± micrognathia, cleft palate, glossoptosis)
    - ♦ laryngeal (malacia)
    - ♦ tracheal (malacia, vascular ring)
    - ♦ mucous plug
    - ♦ cleft palate
- metabolic
  - hypoglycemia
  - inborn errors of metabolism (amino acidemia, organic acidemia, urea cycle disturbance, galactosemia, 1° lactic acidosis)
- neurologic
  - CNS damage (trauma, hemorrhage)
  - drug withdrawal syndromes

## Investigations

- CXR, ABG
- CBC, blood cultures, blood glucose
- ECHO, ECG if indicated

**Table 32. Distinguishing Features of RDS, TTN, MAS**

	RDS ("Hyaline Membrane Disease")	TTN ("Wet Lung Syndrome")	MAS
<b>Etiology</b>	Surfactant deficiency → poor lung compliance due to high alveolar surface tension → atelectasis → ↓ surface area for gas exchange → hypoxia + acidosis → respiratory distress	Delayed resorption of fetal lung fluid → accumulation of fluid in peribronchial lymphatics and vascular spaces → tachypnoea	Meconium is sterile but causes airway obstruction, chemical inflammation, and surfactant inactivation
<b>Gestational age</b>	Preterm	More commonly term and late preterm	Term and post-term
<b>Risk Factors</b>	Maternal diabetes Preterm delivery Male sex Low birth weight Acidosis, sepsis Hypothermia Second born twin	Maternal diabetes Maternal asthma Male sex Macrosomia (>4500 g) Elective caesarean section or short labour Late preterm delivery	Meconium-stained amniotic fluid Post-term delivery
<b>Clinical Presentation</b>	Onset within first few hours of life, worsens over next 24-72 h Respiratory distress (tachypnoea, tachycardia, grunting, intercostal indrawing, nasal flaring, cyanosis, lung crackles) Hypoxia Cyanosis	Tachypnoea within the first few hours of life ± retractions, grunting, nasal flaring Often NO hypoxia or cyanosis	Respiratory distress within hours of birth Small airway obstruction, chemical pneumonitis → tachypnea, barrel chest with audible crackles Hypoxia
<b>CXR Findings</b>	Homogenous infiltrates Air bronchograms Decreased lung volumes May resemble pneumonia (GBS) If severe, "white-out" with no differentiation of cardiac border	Perihilar infiltrates "wet silhouette"; fluid in fissures	Hyperinflation Patchy atelectasis Patchy and coarse infiltrates 10-20% have pneumothorax

**Table 32. Distinguishing Features of RDS, TTN, MAS (continued)**

	<b>RDS</b> <b>("Hyaline Membrane Disease")</b>	<b>TTN</b> <b>("Wet Lung Syndrome")</b>	<b>MAS</b>
<b>Prevention</b>	Prenatal corticosteroids (e.g. Celestone® 12 mg q24h x 2 doses) if risk of preterm delivery <34 wk Monitor lecithin:sphingomyelin (L/S) ratio with amniocentesis, L/S >2:1 indicates lung maturity	Where possible, avoidance of elective caesarean delivery, particularly before 38 wk gestation	If infant is depressed at birth, intubate and suction below vocal cords Avoidance of factor associated with in utero passage of meconium, e.g. post term delivery
<b>Treatment</b>	Resuscitation Oxygen Ventilation Surfactant (decreases alveolar surface tension, improves lung compliance and maintains functional residual capacity)	Supportive Oxygen if hypoxic ventilator support (e.g. CPAP) IV fluids and lavage feeds	Resuscitation Oxygen Ventilatory support Surfactant Inhaled nitric oxide, extracorporeal membrane oxygenation at some centres for PPHN
<b>Complications</b>	In severe prematurity and/or prolonged ventilation, increased risk of bronchopulmonary dysplasia (BPD)	Hypoxaemia Hypercapnea Acidosis PPHN	Hypoxaemia Hypercapnoea Acidosis PPHN Pneumothorax Pneumomediastinum Chemical pneumonitis Secondary surfactant inhibition Respiratory failure
<b>Prognosis</b>	Dependent on gestation at birth and severity of underlying lung disease; long term risks of CLD	Recovery usually expected in 2-5 d	Dependent on severity, mortality up to 20%

**PNEUMONIA**

- see *Pediatric Respiriology*, P93
- consider in infants with prolonged or premature rupture of membranes (PROM), maternal fever, or if mother is GBS positive
- suspect if infant exhibits respiratory distress, temperature instability, or WBC is low, elevated or left-shifted
- symptoms may be non-specific
- CXR: hazy lung and/or distinct infiltrates (may be difficult to differentiate from RDS)

**Retinopathy of Prematurity (ROP)**

- see [Ophthalmology](#), OP41

**Common Neonatal Skin Conditions****Table 33. Common Neonatal Skin Conditions**

<b>Neonatal Skin Conditions</b>	<b>Description</b>
<b>Vasomotor Response</b> (Cutis Marmorata, Acrocyanosis)	Transient mottling when exposed to cold; usually normal, particularly if premature
<b>Vernix Caseosa</b>	Soft, creamy, white layer covering baby at birth
<b>Slate-Grey Nevus of Childhood</b> (‘Mongolian spots’)	Bluish grey macules over lower back and buttocks (may look like bruises); common in dark skinned infants
<b>Capillary Hemangioma</b>	Raised red lesion, which increases in size after birth and involutes; 50% resolved by 5 yr, 90% by 9 yr
<b>Erythema Toxicum</b>	Yellow-white papules surrounded by erythema; common rash, resolves by 2 wk
<b>Milia</b>	Lesions 1-2 mm firm white pearly papules on nasal bridge, cheeks, and palate; self-resolving
<b>Pustular Melanosis</b>	Brown macular base with pustules, seen more commonly in African American infants; may be present at birth
<b>Angiomatous Lesions (Salmon Patch)</b>	Transitory macular capillary hemangiomas of the eyelids and neck (“Angel Kiss” and “Stork Bite”); usually disappears with age
<b>Neonatal Acne</b>	Inflammatory papules and pustules mainly on face; self-resolving

## Sepsis in the Neonate

**Table 34. Sepsis Considerations in the Neonate**

Early Onset (72 h)	Late Onset (>72 h – 28 d)
Vertical transmission, 95% present within 24 h after birth Risk factors: Maternal infection: UTI, GBS positive, previous child with GBS sepsis or meningitis Maternal fever/leukocytosis/chorioamnionitis Prolonged rupture of membranes (>18 h) Preterm labour Pathogens: GBS, <i>E. coli</i> , <i>Listeria</i> most common Pneumonia more common with early onset sepsis	Acquired after birth Most common in preterm infants in NICU (most commonly due to coagulase negative staphylococcus) Other pathogens implicated include GBS, anaerobes, <i>E. coli</i> , <i>Klebsiella</i> , sepsis and meningitis more common than early onset

### Signs of Sepsis

- no reliable absolute indicator of occult bacteremia in infants <3 mo, most specific result has been WBC <5
- temperature instability (hypo/hyperthermia)
- respiratory distress, cyanosis, apnea
- tachycardia/bradycardia
- lethargy, irritability
- poor feeding, vomiting, abdominal distension, diarrhea
- hypotonia, seizures, lethargy
- jaundice, hepatomegaly, petechiae, purpura

### Chronic Perinatal Infections

#### CHEAP TORCHES

Chicken pox /shingles  
Hepatitis B  
Ebstein-Barr virus  
AIDS (HIV)  
Parvovirus B19 (erythema infectiosum)  
Toxoplasmosis  
Other  
Rubella virus  
Cytomegalovirus/Coxsackievirus  
Herpes simplex virus  
Every STI  
Syphilis

See [Obstetrics](#), OB20

## Nephrology

### Approach to Infant/Child with Dehydration

#### Etiology

- decreased intake: poor oral intake during acute illness, breastfeeding difficulties, eating disorders
- increased losses, common sites include:
  - GI: diarrhea, vomiting, bleeding
  - skin/mucous membranes: fever, burns, hemorrhage, stomatitis
  - urinary: osmolar diuresis (e.g. hyperglycemia, DKA), diuretic therapy, diabetes insipidus, post-obstructive/post ATN recovery diuresis
  - respiratory: tachypnea, bronchiolitis, pneumonia

#### Management

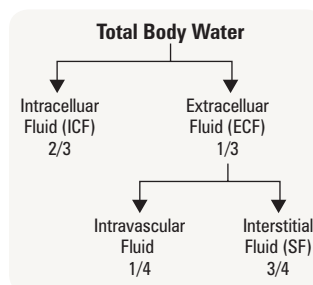

- if suspect dehydration based on history (acute illness, ↓ number of wet diapers, lethargy, changes in mental status, ↑ thirst, etc.), you must:

#### 1) Determine degree of extracellular volume contraction

**Table 35. Assessment of Degree of Extracellular Volume Contraction based on Physical Examination**

	Mild	Moderate	Severe
<2 yr	5%	10%	15%
>2 yr	3%	6%	9%
Pulse (HR)	Normal, full	Rapid	Rapid, weak
Blood Pressure (BP)	Normal	Normal-low	Shock – decreased BP (very late finding in pediatrics and very dangerous)
Urine Output (UO)	Decreased	Markedly decreased	Anuria
Oral Mucosa	Slightly dry	Dry	Parched
Anterior Fontanelle	Normal	Sunken	Markedly sunken
Eyes	Normal	Sunken	Markedly sunken
Skin Turgor	Normal	Decreased	Tenting
Capillary Refill	Normal (<3 s)	Normal to increased	Increased (>3 s)

\* Note that percentages refer to percent loss of pre-illness body weight

**Figure 14. Body fluid compartments**

### Electrolyte Concentrations of Na<sup>+</sup> and K<sup>+</sup> (in mEq/L)

	ICF	ECF
Sodium	10	140
Potassium	150	4

### Assessment of Severity of Dehydration

#### C BASE H<sub>2</sub>O

Capillary refill  
BP  
Anterior fontanelle  
Skin turgor  
Eyes sunken  
HR  
Oral mucosa  
Output of urine

2) Determine the likely electrolyte disturbance

- dependent on etiology of dehydration and type of fluid loss (isotonic vs. hypertonic vs. hypotonic) (See Table 36)

Table 36. Electrolyte content of various bodily fluids

Bodily Fluid	Na <sup>+</sup> concentration (mmol/L)	K <sup>+</sup> concentration (mmol/L)	Cl <sup>-</sup> concentration (mmol/L)	HCO <sub>3</sub> <sup>-</sup> concentration (mmol/L)
Saliva	30-80	20	70	30
Gastric juice	60-80	15	100	0
Pancreatic juice	140	5-10	60-90	40-100
Bile	140	5-10	100	40
Small bowel	140	20	100	25-50
Large bowel	75	30	30	0
Sweat	20-70	5-10	40-60	0

- initial investigations should include blood work for ALL patients looking at:
  - electrolyte disturbances (Na<sup>+</sup>, K<sup>+</sup>, Cl<sup>-</sup>) + glucose
  - acid-base disturbances (blood pH, pCO<sub>2</sub>, HCO<sub>3</sub><sup>-</sup>)
  - impaired renal function (creatinine, BUN)

3) Determine if the child requires oral or intravenous rehydration

- dehydrated child must receive adequate fluid management, including replacement of ongoing losses and providing maintenance fluids
- initial management using oral rehydration therapy (ORT) advantages: ↓ cost, no IV needed, ↓ incidence if iatrogenic hyper/hyponatremia, parental involvement
- indications for intravenous rehydration therapy:
  - severe dehydration, which requires close monitoring and frequent assessment of electrolytes
  - inability to tolerate ORT (e.g. vomiting, alteration in mental status, ileus, monosaccharide malabsorption, etc.)
  - inability to provide ORT
  - failure of ORT in providing adequate rehydration (e.g. persistent diarrhea or vomiting)

4) Return the child to a normal volume and electrolyte status by replacing current deficits and ongoing losses

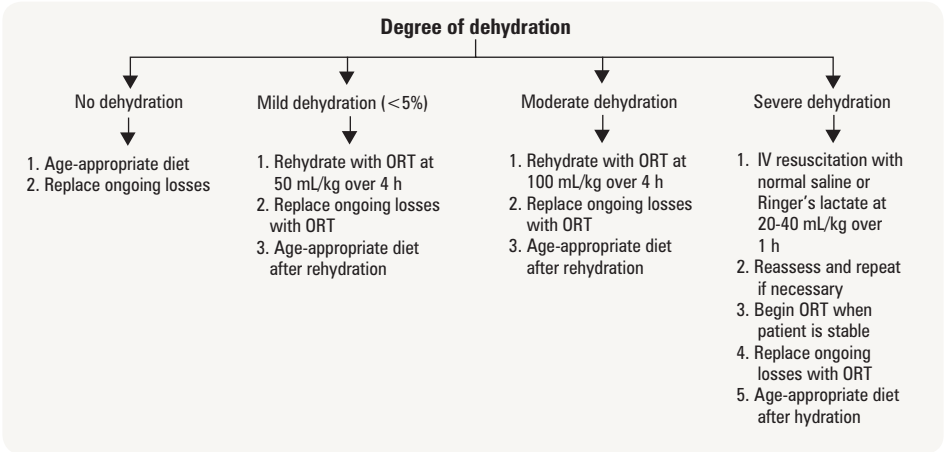

Figure 15. Algorithm for deficit replacement and replacement of ongoing losses in the dehydrated child

## 5) Provide the appropriate fluid and electrolyte maintenance daily requirements (Tables 36 and 37)

**Table 37. Maintenance Fluid Requirements**

Body Weight	100:50:20 Rule (24-h maintenance fluids)	4:2:1 Rule (hourly rate of maintenance fluids)
1-10 kg	100 cc/kg/d	4 cc/kg/h
11-20 kg	50 cc/kg/d	2 cc/kg/h
>20 kg	20 cc/kg/d	1 cc/kg/h

- Types of fluids used:
  - normal saline (NS), Ringer's lactate (RL), half-normal saline (0.45% NaCl), 0.2% NS (for neonates only), D5W, and D10W (for neonates only), add potassium chloride (if hypokalemic)
- Common IV fluid combinations used in pediatrics:
  - first month of life: D5W/0.2 NS + 20 mEq KCl/L (only add KCl if voiding well)
  - children: D5W/NS + 20 mEq KCl/L or D5W/0.45 NS + 20 mEq KCl/L
  - NS: as bolus to restore circulation in dehydrated children (remains almost entirely distributed in intravascular space)
- Correction of Fluid and Electrolyte Deficits
  - if serum  $[Na^+]$  <138-144 mmol/L, use NS or RL
  - if serum  $[Na^+]$  145-154 mmol/L, IV fluid sodium concentration should approximate 0.45 NS
  - if serum  $[Na^+]$  >154 mmol/L, risk of **cerebral edema** with rapid rehydration of hypotonic solutions (i.e. NS) therefore replace fluid slowly with close monitoring.

## 6) Continue to monitor fluid and electrolyte status

- accurate monitoring of daily fluid intake (oral and IV) and ongoing losses (urine output, diarrhea, emesis, drains)
- if child receiving >50% of maintenance fluids through IV, serum electrolyte values should be monitored DAILY and adjusted accordingly
- avoid iatrogenic hyper/hyponatremia, keep the possibility of SIADH in mind

### Special Consideration – Syndrome of Inappropriate ADH (SIADH)

**Clinical Signs:** hyponatremia and excretion of concentrated urine.

**Renal Failure:** certain medications (e.g. morphine), post-op, pain, nausea and vomiting, pulmonary disease (e.g. pneumonia), CNS disease (e.g. meningitis).

**Caution:** acute hyponatremia is associated with rapid administration of hypotonic IV, this can lead to cerebral edema and herniation.

## Common Pediatric Renal Diseases

**Table 38. Common Manifestations of Renal Disease**

Neonate	Common Causes
Flank Mass	Hydronephrosis, polycystic disease (ARPKD or ADPKD), tumour
Hematuria	Renal vein thrombosis, asphyxia, malformation, trauma
Anuria/Oliguria	Bilateral renal agenesis, obstruction, asphyxia
Child and Adolescent	Differential Diagnosis
Cola/Red-Coloured Urine	Acute glomerulonephritis (post-Strep GN, HSP, IgA nephropathy, etc.), hemoglobinuria (hemolysis), myoglobinuria (rhabdomyolysis)
Gross Hematuria	Urologic disease (nephrolithiasis, trauma, etc.), urinary tract infection (UTI), acute glomerulonephritis
Edema	Nephrotic syndrome, nephritis, acute/chronic renal failure, consider cardiac or liver disease
Hypertension	Glomerulonephritis, renal failure, dysplasia (consider coarctation, drugs, endocrine causes)
Polyuria	DM, central and nephrogenic diabetes insipidus, renal Fanconi's syndrome (genetic/metabolic/acquired causes), hypercalcemia, polyuric renal failure (renal dysplasia)
Proteinuria	Orthostatic, nephrotic syndrome (minimal change disease, etc.), glomerulonephritis
Oliguria	Dehydration, acute tubular necrosis (ATN), interstitial nephritis, acute or chronic kidney disease (i.e. renal failure)
Urgency	UTI, vulvovaginitis

## Hemolytic Uremic Syndrome (HUS)

### Definition

- simultaneous occurrence of the triad of 1) non-immune microangiopathic hemolytic anemia, 2) thrombocytopenia and 3) acute renal injury

### Epidemiology

- annual incidence of 1-2 per 100,000 in Canada
- most common cause of acute renal failure in children

### Etiology

- diarrhea positive HUS: 90% of pediatric HUS from *E. coli* O157:H7 shiga toxin or verotoxin
- diarrhea negative HUS: other bacteria, viruses, familial, drugs

### Pathophysiology

- toxin binds, invades and destroys colonic epithelial cells, causing bloody diarrhea
- toxin enters the systemic circulation, attaches and injures endothelial cells (especially in kidney) causing a release of endothelial products (e.g. von Willebrand factor, platelet aggregating factor)
- form platelet/fibrin thrombi in multiple organ systems (e.g. kidney, pancreas, brain, etc.) resulting in thrombocytopenia
- RBCs are forced through occluded vessels resulting in fragmented RBCs (schistocytes) that are removed by the reticuloendothelial system (hemolytic anemia)

### History and Physical

- initial presentation of abdominal pain and diarrhea, followed by bloody diarrhea
- within 5-7 d begins to show signs of anemia, thrombocytopenia and renal insufficiency
- history: weakness, lethargy, oliguria
- physical exam: pallor, jaundice (hemolysis), edema, petechiae, hypertension

### Investigations

- CBC (anemia, thrombocytopenia), blood smear (schistocytes), electrolytes, renal function, urinalysis (microscopic hematuria), stool cultures and verotoxin/shigella toxin assay

### Management

- mainly supportive: nutrition, hydration, ventilation (if necessary), blood transfusion for symptomatic anemia
- monitor electrolytes and renal function: dialysis if electrolyte abnormality cannot be corrected, fluid overload, or uremia
- steroids are NOT helpful
- antibiotics are contraindicated because death of bacteria leads to increased toxin release and worse clinical course

### Prognosis

- 5-10% mortality, 10-30% renal damage

## Nephritic Syndrome

### Definition

- acute or chronic syndrome affecting the kidney, characterized by glomerular injury and inflammation, and defined by hematuria (>5 RBCs per high-powered microscope field) and the presence of dysmorphic RBCs and RBC casts on urinalysis
- often accompanied by at least one of proteinuria (<50 mg/kg/d), edema, hypertension, azotemia, and oliguria

### Epidemiology

- highest incidence in children aged 5-15 yr old

### Etiology

- humoral immune response to a variety of etiologic agents → immunoglobulin deposition → complement activation, leukocyte recruitment, release of growth factors/cytokines → glomerular inflammation and injury → porous podocytes → hematuria + RBC casts ± proteinuria
- hypertension secondary to fluid retention and increased renin secretion by ischemic kidneys
- primary (idiopathic) versus secondary (to a systemic disease), low complement levels versus normal complement levels (Table 39)

**Table 39. Major Causes of Nephritic Syndrome**

	Decreased C3	Normal C3
<b>Primary</b>	Post-infectious GN (most common cause of acute GN in pediatrics) Membranoproliferative <ul style="list-style-type: none"> <li>• Type I (50-80%)</li> <li>• Type II (&gt;80%)</li> </ul>	IgA Nephropathy Idiopathic rapidly progressive GN Anti-GBM disease
<b>Secondary</b>	SLE Bacterial endocarditis Abscess or shunt nephritis Cryoglobulinemia	Henoch-Schönlein purpura (very common) Polyarteritis nodosa Granulomatosis with polyangiitis (GPA) Goodpasture's syndrome

#### Nephritic Syndrome

##### PHAROH

Proteinuria (<50 mg/kg/d)  
Hematuria  
Azotemia  
RBC casts  
Oliguria  
Hypertension

**Risk Factors**

- recent streptococcal pharyngitis or skin infection, systemic illnesses (see *Etiology of Nephritic Syndrome*, P82)

**History and Physical**

- often asymptomatic; some overlap in clinical findings for nephritic and nephrotic syndrome
- gross hematuria, mild-moderate edema, oliguria
- signs and symptoms suggestive of underlying systemic causes (e.g. fever, arthralgias, rash, dyspnea, pulmonary hemorrhage)

**Investigations**

- urine
  - dipstick (hematuria, 0 to 2+ proteinuria) and microscopy (>5 RBCs per high-powered microscope field, acanthocytes, RBC casts)
  - first morning urine protein/creatinine ratio (<200 mg/mmol)
- blood work
  - impaired renal function (↑ Cr and BUN) resulting in ↓ pH and electrolyte abnormalities (hyperkalemia, hyperphosphatemia, hypocalcemia)
  - mild anemia on CBC (secondary to hematuria)
  - hypoalbuminemia (secondary to proteinuria)
  - appropriate investigations to determine etiology: C3/C4 levels, serologic testing for recent streptococcal infection (ASOT, anti-hyaluronidase, anti-streptokinase, anti-NAD, anti-DNAse B), ANA, anti-DNA antibodies, ANCA, serum IgA levels, anti-GBM antibodies
- renal biopsy
  - should be considered only in presence of: acute renal failure, no evidence of streptococcal infection, normal C3/C4

**Management**

- treat underlying cause
- symptomatic
  - renal insufficiency: supportive (dialysis if necessary), proper hydration
  - hypertension: salt and fluid restriction (but not at expense of renal function), ACE inhibitors or ARBs for chronic persistent HTN (not acute cases since ACE inhibitors or ARBs may decrease GFR further)
  - edema: salt and fluid restriction, possibly diuretics (avoid if significant intravascular depletion)
- corticosteroids if indicated: IgA nephropathy, lupus nephritis, etc.

**Prognosis**

- dependent on underlying etiology
- complications include hypertension, heart failure, pulmonary edema, chronic kidney injury (requiring renal transplant)

## Nephrotic Syndrome

**Definition**

- clinical syndrome affecting the kidney, characterized by significant proteinuria, peripheral edema, hypoalbuminemia, and hyperlipidemia

**Epidemiology**

- highest incidence in children of 2 to 6 yr old, M>F

**Etiology**

- primary nephrotic syndrome; nephrotic syndrome (NS) in the absence of systemic disease (most common cause in pediatrics)
  - glomerular inflammation ABSENT on renal biopsy: minimal change disease (>90% of all NS), focal segmental glomerular sclerosis (FSGS)
  - glomerular inflammation PRESENT on renal biopsy: membranoproliferative glomerulonephritis, IgA nephropathy, other minor causes
- secondary nephrotic syndrome: NS associated with systemic disease or due to another process causing glomerular injury (very rare in pediatrics)
  - autoimmune: SLE, diabetes mellitus, rheumatoid arthritis, etc.
  - genetic: sickle cell disease, Alport syndrome, etc.
  - infections: HBV/HCV, post-streptococcal, infective endocarditis, HUS, HIV, etc.
  - malignancies: leukemia, lymphoma, etc.
  - medications: captopril, penicillamine, NSAIDs, anticonvulsants, etc.
  - vasculitides: Henoch-Schönlein, GPA, etc.
- congenital nephrotic syndrome: congenital nephropathy of the Finnish type, Denys-Drash syndrome, etc.

**PALE**

Proteinuria (>50 mg/kg/d)  
HypoAlbuminemia (<20 g/L)  
HyperLipidemia  
Edema

Daily protein excretion can be estimated from a random urine protein/creatinine ratio.

**Risk Factors**

- family history, certain systemic illnesses and medications (as per *Etiology*, P83)

**History and Physical**

- non-specific (e.g. irritability, malaise, fatigue, anorexia, diarrhea)
- edema
  - often first sign; detectable when fluid retention exceeds 3 to 5 percent of body weight
  - starts periorbital and often pretibial → edematous areas are white, soft, and pitting
  - gravity dependent: periorbital edema ↓ and pretibial edema ↑ over the day
  - anasarca may develop (i.e. marked periorbital and peripheral edema, ascites, pleural effusions, scrotal/labial edema)
- decrease in effective circulating volume (e.g. tachycardia, hypertension, oliguria, etc.)
- foamy urine is a possible sign of proteinuria

**Investigations**

- urine
  - urine dipstick (3 to 4+ proteinuria, microscopic hematuria) and microscopy (oval fat bodies, hyaline casts)
  - first morning urine protein/creatinine ratio (>200 mg/mmol)
- blood work
  - diagnostic: hypoalbuminemia (<25 g/L), hyperlipidemia/hypercholesterolemia (total cholesterol >5 mmol/L)
  - secondary: electrolytes (hypocalcemia, hyperkalemia, hyponatremia), renal function (↑ BUN and Cr), coagulation profile (↓ PTT)
  - appropriate investigations to rule out secondary causes of NS: CBC, blood smear, C3/C4, ANA, HBV/HCV titers, ASOT, HIV serology, etc.
- consider renal biopsy if:
  - HTN (↑ risk of FSGS), gross hematuria, irenal function, low serum C3/C4
  - no response to steroids after 4 wk of therapy
  - frequent relapses (>2 relapses in 6 mo)
  - presentation before first year of life (high likelihood of congenital nephrotic syndrome)
  - presentation ≥12 yr (rule out more serious renal pathology than minimal change disease)

**Management**

- minimal change disease: oral prednisone 2 mg/kg/d (or equivalent) for up to 12 wk → varicella status should be known before starting
- consider cytotoxic agents, immunomodulators or high-dose pulse corticosteroid if steroid resistant
- symptomatic
  - edema: salt and fluid restriction, possibly diuretic (avoid if significant intravascular depletion); furosemide + albumin for anasarca
  - hyperlipidemia: generally resolves with remission; limit dietary fat intake; consider statin therapy if persistently nephrotic
  - hypoalbuminemia: IV albumin and lasix not routinely given; consider if refractory edema
  - abnormal BP: control BP; fluid resuscitation if severe intravascular depletion; ACE inhibitors or ARBs for persistent HTN
- diet: NAS (no added salt) diet; monitor caloric intake and supplement with Ca<sup>2+</sup> and Vit D if on corticosteroids
- daily weights and blood pressure to assess therapeutic progress
- secondary infections:
  - treat with appropriate antimicrobials; antibiotic prophylaxis not recommended
  - pneumococcal vaccine at diagnosis and varicella vaccine after remission; varicella Ig + acyclovir if exposed while on corticosteroids
- secondary hypercoagulability: mobilize, avoid hemoconcentration due to hypovolemia, prompt sepsis treatment; heparin if thrombi occur

**Prognosis**

- generally good: 80% of children responsive to corticosteroids
- up to 2/3 experience relapse, often multiple times; sustained remission with normal kidney function usually by adolescence
- complications: ↑ risk of infections (spontaneous peritonitis, cellulitis, sepsis); hypercoagulability due to decreased intravascular volume and antithrombin III depletion (pulmonary embolism, renal vein thrombosis; intravascular depletion-hypotension, shock, renal failure; side effects of drugs)

**Long-term steroid use associated with:**

- Increased appetite
- Impaired growth
- Behavioural changes
- Risk of infection
- Salt and water retention
- Hypertension
- Bone demineralization

## Hypertension in Childhood

### Definition

- hypertension: systolic and/or diastolic blood pressure (BP) that is  $\geq 95$ th percentile for sex, age and height (Table 40) on  $\geq 3$  occasions
- prehypertension: systolic and/or diastolic BP  $\geq 90$ th percentile but  $< 95$ th percentile OR BP  $\geq 120/80$  irrespective of age, gender and height

**Table 40. 95th Percentile Blood Pressures (mmHg)**

Age (Years)	Female		Male	
	50th Percentile for Height	75th Percentile for Height	50th Percentile for Height	75th Percentile for Height
1	104/58	105/59	102/57	104/58
6	111/73	112/73	114/74	115/75
12	123/80	124/81	123/81	125/82
17	129/84	130/85	136/87	138/88

Adapted from Update on the 1987 Task Force Report on High Blood Pressure in Children and Adolescents working group report from the National High Blood Pressure Education Program

### Epidemiology

- increasing prevalence of both hypertension and prehypertension over the last 25+ yr
- prevalence: 3-5% for hypertension, 7-10% for prehypertension; M>F

### Etiology

- primary HTN
  - diagnosis of exclusion
  - most common in older children ( $\geq 10$  yr), especially if positive family history, overweight and only mild hypertension
  - responsible for  $\sim 90\%$  of cases of HTN in adolescents, rarely in young children
- secondary HTN
  - identifiable cause of HTN
  - responsible for majority of childhood hypertension
  - most likely etiology dependent on age (see Table 41), renal parenchymal disease most common cause (60 to 70% of cases)
- always consider white coat HTN for all ages

**Table 41. Etiology of Secondary Hypertension by Age Group**

System	Neonates	1 month to 6 years	7-12 years	>13 years
<b>Endocrine/Metabolic</b>	Congenital adrenal hyperplasia	Wilms' tumour ( $\uparrow$ renin) Neuroblastoma ( $\uparrow$ catecholamines)	Endocrinopathies*	Endocrinopathies*
<b>Renal</b>	Congenital renal disease	Renal parenchymal disease	Renal parenchymal disease	Renal parenchymal disease
<b>Vascular</b>	Coarctation of the aorta Renal artery thrombosis	Coarctation of the aorta Renal artery stenosis (RAS)	Renovascular abnormalities	
<b>Drugs</b>		Corticosteroids Cyclosporine and tacrolimus	Corticosteroids OCP Cyclosporine and tacrolimus	Corticosteroids OCP Cyclosporine and tacrolimus Recreational drugs (amphetamines, cocaine, etc.)
<b>Other</b>			iatrogenic	iatrogenic

\*Note: endocrinopathies may include hyperthyroid, hyperparathyroid, Cushing's syndrome, primary hyperaldosteronism/Conn's syndrome, pheochromocytoma

### Risk Factors

- primary HTN: male gender, positive family history, metabolic syndrome, OSA, African-American, prematurity/low-birth weight
- secondary HTN: history of renal disease, abdominal trauma, family history of autoimmune diseases, umbilical artery catheterization

### History

- often asymptomatic, but can include FTT, fatigue, epistaxis
- symptoms of hypertensive emergency
  - neurologic: headache, seizures, focal complaints, change in mental status, visual disturbances
  - cardiovascular: symptoms of MI or heart failure (chest pain, palpitations, cough, shortness of breath)
- symptoms of secondary HTN: guided by etiology above; ask about medications and recreational drugs (current and past)

**Physical**

- BP measurement (make sure correct cuff size is used), plot on growth chart, BMI
- look for signs of hypertensive emergency (e.g. full neurologic exam, ophthalmoscopy, precordial exam, peripheral pulses, perfusion status)
- look for signs of secondary HTN

**Investigations**

- laboratory:
  - urine dipstick for hematuria and/or proteinuria (renal disease), urine catecholamines (pheochromocytoma, neuroblastoma)
  - blood work: renal function tests (electrolytes, Cr, BUN), consider renin and aldosterone levels (RAS, Conn's syndrome, Wilms' tumour)
  - other specific hormones if indicated on history and physical
- imaging: echocardiography (coarctation, heart function), abdominal U/S (RAS, abdominal mass), renal radionuclide imaging (renal scarring)
- other: ocular exam

**Management**

- treat underlying cause
- non-pharmacologic: modify concurrent cardiovascular risk factors (rate reduction, exercise, salt restriction, smoking cessation, etc.)
- pharmacologic: gradual lowering of BP using thiazide diuretics; no antihypertensives have been formally studied in children; if hypertensive emergencies: hydralazine, labetalol, sodium nitroprusside
- management of end organ damage (e.g. retinopathy, LVH)
- consider referral to specialist

**Prognosis**

- end-organ damage (similar to adults) including: left ventricular hypertrophy, CHF, cerebrovascular insults, renal disease, retinopathy

**Signs of Secondary HTN**

- Edema (renal parenchymal disease)
- Abdominal or renal bruit (RAS)
- Differential 4 limb BP/diminished femoral pulses (coarctation)
- Abdominal mass (Wilms', neuroblastoma)
- Goiter/skin changes (hyperthyroidism)
- Ambiguous genitalia (CAH)

**Pediatric Blood Pressure Calculation**

sBP = age x 2 + 90

dBP = 2/3 x sBP

## Neurology

### Seizure Disorders

- see [Neurology](#), N14

**Differential Diagnosis of Seizures in Children**

- benign febrile seizure
- CNS
  - infection, tumour, hypoxic ischemic encephalopathy
  - trauma, hemorrhage
- metabolic causes (e.g. hypoglycemia, hypocalcemia, hyponatremia)
- idiopathic epilepsy and epileptic syndromes
- others:
  - neurocutaneous syndromes
  - arteriovenous malformation
  - drug ingestions/withdrawal
- seizure mimics

**Investigations**

- lab tests: CBC, electrolytes, calcium, magnesium, glucose
- toxicology screen if indicated
- EEG,
- CT/MRI, if indicated, e.g. focal neurological deficit or has not returned to baseline after several hours after seizure
- LP, if first-time non-febrile seizure but not indicated for determining recurrence risk of benign febrile seizures or to determine seizure type or epileptic syndrome

Heart problems, such as long QT syndrome and hypertrophic cardiomyopathy, are often misdiagnosed as epilepsy. Include cardiac causes of syncope in your differential diagnosis, particularly when the episodes occur during physical activity.

**Seizure Mimics**

- Breath holding
- Night terror
- Benign paroxysmal vertigo
- Narcolepsy
- Pseudoseizure
- Syncope
- Tic
- Hypoglycemia
- TIA

**CHILDHOOD EPILEPTIC SYNDROMES****Infantile Spasms**

- brief, repeated symmetric contractions of neck, trunk, extremities (flexion and extension) lasting 10-30 s
- occur in clusters; often associated with developmental delay; onset 4-8 mo
- 20% unknown etiology (usually good response to treatment); 80% due to metabolic or developmental abnormalities, encephalopathies, or are associated with neurocutaneous syndromes (usually poor response to treatment)

- can develop into West syndrome (infantile spasms, psychomotor developmental arrest, and hyperarrhythmia) or Lennox Gastaut (see below)
- typical EEG: hypsarrhythmia (high voltage slow waves, spikes and polyspikes, background disorganization)
- management: ACTH, vigabatrin, benzodiazepines

### Lennox-Gastaut

- characterized by triad of 1) multiple seizure types, 2) diffuse cognitive dysfunction and 3) slow generalized spike and slow wave EEG
- onset commonly 3-5 yr of age
- seen with underlying encephalopathy and brain malformations
- management: valproic acid, benzodiazepines and ketogenic diet; however, response often poor

### Juvenile Myoclonic Epilepsy (Janz Syndrome)

- myoclonus particularly in morning; frequently presents as generalized tonic-clonic seizures
- adolescent onset (12-16 yr of age); autosomal dominant with variable penetrance
- typical EEG: 3.5-6 Hz irregular spike and wave, increased with photic stimulation
- management: lifelong treatment (valproic acid); excellent prognosis

### Childhood Absence Epilepsy

- multiple daily absence seizures lasting <30 s without post-ictal state that may resolve spontaneously or become generalized in adolescence
- peak age of onset 6-7, F>M, strong genetic predisposition
- typical EEG: 3/s spike and wave
- management: valproic acid or ethosuximide

### Benign Focal Epilepsy of Childhood with Rolandic/Centrotemporal Spikes

- focal motor seizures involving tongue, mouth, face, upper extremity usually occurring in sleep-wake transition states; remains conscious, but aphasic post-ictally
- onset peaks at 5-10 yr of age, 16% of all non-febrile seizures; remits spontaneously in adolescence without sequelae
- typical EEG: repetitive spikes in centrotemporal area with normal background
- management: frequent seizures controlled by carbamazepine, no medication if infrequent seizures

### General Approach to Treatment

- medication
  - initiate: treatment with drug appropriate to seizure type; often initiate anticonvulsants if >2 unprovoked afebrile seizures within 6-12 mo
  - optimize: start with one drug and increase dosage until seizures controlled
  - if no effect, switch over to another before adding a second anticonvulsant
  - continue anticonvulsant treatment until patient free of seizures for >2 yr, then wean medications over 4-6 mo
- ketogenic diet (high fat diet): used in patients who do not respond to polytherapy or who do not wish to take medication (valproic acid contraindicated in conjunction with ketogenic diet because may increase hepatotoxicity)
- education for patient and parents including education and precautions in daily life (e.g. buddy system, showers instead of baths)
- legal obligation to report to Ministry of Transportation if patient wishes to drive

### Generalized and Partial Seizures

- see [Neurology](#), N14

#### Ketogenic Diet and other Dietary Treatments for Epilepsy

*Cochrane DB of Syst Rev* 2012;3:CD001903

**Study:** Systematic review of all studies of ketogenic and related diets. Included the review of 4 RCTs, 6 prospective studies and 5 retrospective studies.

**Population:** Adults and children with diagnosed epilepsy of any type.

**Intervention:** Ketogenic diet, control (placebo diet, any treatment with known antiepileptic properties)

**Main outcome measure:** Seizure control at 3, 6, 12 mo.

**Results:** Studies showed a response rate of at least 38-50% seizure reduction at 3 mo. This response was maintained for up to a year. A range of side effects were reported. The most frequent were gastrointestinal effects (30%).

**Conclusion:** The ketogenic diet is a valid option for people with medically-intractable epilepsy.

## Febrile Seizures

### Epidemiology

- most common cause of seizure in children (3-5% of children)
- M>F; age 6 mo-6 yr

### Clinical Presentation

- short (~1 min, always <5 min) generalized tonic-clonic seizure with short post-ictal state
- often with associated illness or fever and family history
- no evidence of CNS infection/inflammation before or after seizure; no history of non-febrile seizures

**Table 42. Comparison of Simple and Complex Febrile Seizures**

Simple/Benign (70-80%)	Complex/Atypical (20-30%)
Duration <15 min (95% <5 min)	Duration >15 min
Generalized tonic-clonic	Focal onset or focal features during seizure
No recurrence in 24-h period	Recurrent seizures (>1 in 24-h period)
No neurological impairment or developmental delay before or after seizure	Previous neurological impairment or neurological deficit after seizure

} any one of

**Workup**

- history: determine focus of fever, description of seizure, medications, trauma history, development, family history
- exam: LOC, signs of meningitis, neurological exam, head circumference, focus of infection
- septic work-up including LP if suspecting meningitis (strongly consider if child <12 mo; consider if child is 12-18 mo; only if meningeal sign present if child >18 mo)
- if simple febrile seizure, investigations only for determining focus of fever
- EEG not warranted unless complex febrile seizure or abnormal neurologic findings

**Management**

- counsel and reassure patient and parents:
  - febrile seizures do not cause brain damage
  - very small risk of developing epilepsy: 9% in child with multiple risk factors (i.e. development or neurological abnormalities prior to seizure, family history of complex febrile seizure, multiple simple febrile seizure); 2% in child with febrile simple seizures compared to 1% in general population
  - 33% chance of recurrence (mostly within 1 yr of first seizure and in children <1 yr old)
- antipyretics (e.g. acetaminophen) and fluids for comfort (though neither prevent seizure)
- prophylaxis not recommended
- if high risk for recurrent or prolonged seizures, have rectal or sublingual lorazepam at home
- treat underlying cause of fever

## Recurrent Headache

- see [Neurology](#), N38

**Differential Diagnosis**

- primary headache: tension, migraine, cluster
- secondary headache: see [Neurology](#), N39

**General Assessment**

- if unremarkable history and neurological and general physical exam is negative, most likely diagnosis is migraine or tension-type headache
- CT or MRI if history or physical reveals red flags
- inquire about level of disability, academic performance, after-school activities

**MIGRAINE**

- 4-5% of school aged children; F>M after puberty
- heterogeneous autosomal dominant inheritance with incomplete penetrance (majority of patients have a positive family history)

**Types**

- common (no aura): most common in children, often with intense nausea and vomiting
- classic (with aura)
- complicated: basilar, ophthalmoplegic, confusional, hemiplegic

**Clinical Features**

- infancy: spells of irritability, sleepiness, pallor, and vomiting
- young child: periodic headaches with nausea and vomiting that is relieved by rest
- older child: usually unilateral throbbing headaches with photophobia or phonophobia

**Prognosis and Treatment**

- >50% undergo spontaneous prolonged remission after 10 yr of age
- non-pharmacological treatment and prophylaxis: rest in quiet, dark room, avoid triggers (poor sleep, stress, chocolate, caffeine), biofeedback techniques, exercise, magnesium supplementation
- pharmacological treatment: early analgesia (e.g. ibuprofen), sumatriptan or other triptans if >12 yr of age
- pharmacological prophylaxis:  $\beta$ -blockers (e.g. propranolol), antihistamines, antidepressants (e.g. amitriptyline/nortriptyline), calcium-channel blockers, anticonvulsants (e.g. divalproex sodium)

**Headache – Red Flags**

- New headache
- Worst headache of their lives
- Acute onset
- Focal neurological deficits
- Constitutional symptoms
- Worse in morning
- Worse with bending over, coughing, straining
- Change in level of consciousness
- Sudden mood changes
- Disturbed sleep
- Fatigue
- Withdrawal from social activities
- Chronic systemic signs (e.g. weight loss, fever, anorexia, focal neurological signs)

## TENSION HEADACHES

### Clinical Features

- usually bilateral pressing tightness (aching, non-throbbing) anywhere on the cranium
- building in intensity; lasting 30 min-days
- no nausea/vomiting, not aggravated by physical activity

### Management

- reassurance, supportive counseling (e.g. explain how stress may cause a headache)
- rule out refractory errors in eyesight
- mild analgesia (NSAIDs, acetaminophen)

## ORGANIC HEADACHES

- organic etiology often suggested with occipital headache especially in pre-school aged child and red flags (e.g. ataxia)
- with increased ICP
  - etiology: brain tumours, hydrocephalus, meningitis, encephalitis, cerebral abscess, pseudotumour cerebri, subdural hematoma
  - characteristics: diffuse early morning headaches, early morning vomiting, headache worsened by increased ICP (cough, sneeze, Valsalva); as ICP increases, headache is constant and child is lethargic and irritable
- without increased ICP
  - etiology: cerebral arteriovenous malformation (AVM), aneurysm, collagen vascular diseases, subarachnoid hemorrhage, stroke

## Hypotonia

- decreased resistance to passive movements – “floppy baby”

### Differential Diagnosis

- central
  - chromosomal (Down, Prader-Willi, Fragile X syndromes)
  - metabolic (hypoglycemia, kernicterus)
  - perinatal problems (asphyxia, ICH)
  - endocrine (hypothyroidism, hypopituitarism)
  - infections (TORCH)
  - CNS malformations
  - dysmorphic syndromes
- peripheral
  - motor neuron (e.g. spinal muscular atrophy, polio)
  - peripheral nerve (e.g. Charcot-Marie-Tooth syndrome)
  - neuromuscular junction (e.g. myasthenia gravis)
  - muscle fibres (e.g. mitochondrial myopathy, muscular dystrophy, myotonic dystrophy)

### History and Physical

- proper assessment of tone requires accurate determination of gestational age
- differentiate between upper motor neuron from lower motor neuron signs; spontaneous posture (spontaneous movement, movement against gravity, frog-leg position); muscle weakness; joint mobility (hyperextensibility); muscle bulk, presence of fasciculations
- postural maneuvers:
  - traction response: pull to sit, look for flexion of arms to counteract traction and head lag
  - axillary suspension: suspend infant by holding at axilla and lifting; hypotonic babies will slip through grasp because of low shoulder girdle tone
  - ventral suspension: infant is prone and supported under the abdomen by one hand; infant should be able to hold up extremities; inverted “U” posturing demonstrates hypotonia, i.e. baby will drape self over examiner’s arms
- dysmorphic features, cognitive ability, reflexes, power

### Investigations

- rule out systemic disorders (e.g. blood glucose, CK and serum/urine investigations for multiple etiologies including mitochondrial causes)
- neuroimaging: MRI/MRS when indicated
- EMG, muscle biopsy/NCS
- chromosome analysis, genetic testing, metabolic testing, neuromuscular testing

### Treatment

- depends on etiology: some treatments available for specific diagnosis
- counsel parents on prognosis and genetic implications
- refer patients for specialized care, refer for rehabilitation, OT, PT, assess feeding ability

Causes of hypotonia that respond to rapid treatment: hypokalemia, hypermagnesemia, acidemia, toxins, drugs, hypoglycemia, seizure, infection, intracranial bleeding, hydrocephalus.

## Cerebral Palsy (CP)

### Definition

- a symptom complex, not a disease
- non-progressive central motor impairment syndrome due to insult to or anomaly of the immature CNS
- incidence: 1.5-2.5 per 1000 live births (industrialized nations)
- life expectancy is dependent on the degree of mobility and intellectual impairment, not on severity of CNS lesion

### Etiology

- often obscure, no definite etiology identified in 1/3 of cases
- 10% related to intrapartum asphyxia; 10% due to postnatal insult (infections, asphyxia, prematurity with intraventricular hemorrhage and trauma)
- association with low birth weight babies

### Clinical Presentation

**Table 43. Types of Cerebral Palsy**

Type	% of Total CP	Characteristics	Area of Brain Involved
<b>Spastic</b>	70-80%	Truncal hypotonia in 1 <sup>st</sup> yr Increased tone, increased reflexes, clonus Affects one limb (monoplegia), one side of body (hemiplegia), both legs (diplegia), both arms and legs (quadriplegia)	UMN of pyramidal tract Diplegia associated with periventricular leukomalacia in premature babies Quadriplegia associated with HIE (asphyxia), associated with higher incidence of MR
<b>Athetoid/Dyskinetic</b>	10-15%	Athetosis (involuntary writhing movements) ± chorea (involuntary jerky movements) Can involve face, tongue (results in dysarthria)	Basal ganglia (may be associated with kernicterus)
<b>Ataxic</b>	<5%	Poor coordination, poor balance (wide based gait) Can have intention tremor	Cerebellum
<b>Mixed</b>	10-15%	More than one of the above motor patterns	

### Other Signs

- uncoordinated swallowing → aspiration
- microcephaly (25%)
- seizures
- mental retardation, learning disabilities
- delay in motor milestones
- visual, hearing impairment

### Investigations

- may include metabolics, chromosome studies, serology, neuroimaging, EMG, EEG (if seizures), ophthalmology, audiology

### Treatment

- maximize potential through multidisciplinary services such as primary care physician, OT, PT, SLP, school supports, etc.
- orthopedic management (e.g. dislocations, contractures, rhizotomy)
- management of symptoms: spasticity (baclofen, Botox®), constipation (stool softeners)

## Neurocutaneous Syndromes

- characterized by tendency to form tumours of the CNS, PNS, viscera and skin

### Neurofibromatosis Type I (NF-1)

- autosomal dominant but 50% are the result of new mutations
- also known as von Recklinghausen disease
- incidence 1:3000, mutation in *NF1* gene on 17q11.2 (codes for neurofibromin protein)
- learning disorders, abnormal speech development and seizures are common
- diagnosis of NF-1 requires 2 or more of:
  - ≥6 café-au-lait spots (>5 mm if prepubertal, >1.5 cm if postpubertal)
  - ≥2 neurofibromas of any type or one plexiform neurofibroma
  - ≥2 Lisch nodules (hamartomas of the iris)
  - optic glioma
  - freckling in the axillary or inguinal region
  - a distinctive bony lesion (e.g. sphenoid dysplasia, cortical thinning of long bones)
  - a first degree relative with confirmed NF-1

In neurocutaneous syndromes, the younger the child at presentation, the more likely they are to develop mental retardation.

**Neurofibromatosis Type II (NF-2)**

- autosomal dominant
- incidence 1:33,000
- characterized by predisposition to form intracranial, spinal tumours
- diagnosed when either bilateral vestibular schwannomas found, or a first-degree relative with NF-2 and either a neurofibroma, meningioma, glioma, or schwannoma
- also associated with posterior subcapsular cataracts
- treatment consists of monitoring for tumour development and surgery

**Sturge-Weber Syndrome**

- port-wine nevus syndrome in V1 distribution with associated angiomatous malformations of the brain causing contralateral hemiparesis and hemiatrophy
- also associated with seizure, glaucoma and mental retardation

**Tuberous Sclerosis**

- autosomal dominant inheritance; 50% new mutations
- adenoma sebaceum (angiokeratomas on face, often in malar distribution), Shagreen patch (isolated raised plaque over lower back, buttocks), "ash leaf" hypopigmentation seen with Wood's lamp (UV light)
- cardiac rhabdomyomas, kidney angiomyolipoma, mental retardation and seizures
- cerebral cortex tubers (areas of cerebral dysplasia); subependymal nodules (SEN) may evolve into giant cell astrocytomas (may cause obstructive hydrocephalus)
- calcifications within the SEN are seen on CT, MRI (especially around the foramen of Monro)
  - these may obstruct the foramen and cause hydrocephalus

**Acute Disseminated Encephalomyelitis (ADEM)****Epidemiology**

- median age of onset 5-8 yr; male predominance
- annual incidence in North America is estimated to be 0.4 per 100,000 children <20 yr of age

**Pathophysiology**

- immune-mediated inflammatory disorder of the CNS; characterized by a widespread demyelination predominantly affecting the white matter of the brain and spinal cord (similar to multiple sclerosis)
- usually preceded by a viral infection or vaccination
- absence of clear precedent event has been reported in 26% of patients

**Clinical Presentation**

- often occurs 2 d to 4 wk after a clinically evident infection or vaccination
- clinical course is rapidly progressive, develops over hours to maximum deficits within days
- headache, nausea, vomiting, pyrexia, malaise
- rapid onset encephalopathy, multifocal deficits, seizures
- pyramidal syndrome, cerebellar ataxia, brainstem involvement

**Investigations**

- LP: CSF showing variable pleocytosis and oligoclonal banding
- MRI: large, multifocal, poorly marginated regions of demyelination affecting bilateral subcortical white matter, and deep grey matter (thalamus, basal ganglia); lesions show complete or partial resolution on follow-up, with absence of new clinically silent lesions

**Treatment**

- high dose corticosteroids and supportive measures

**Prognosis**

- favourable, though some residual deficits often exist

# Respirology

## Approach to Dyspnea

- see Table 1, *Average Vitals at Various Ages*, P3

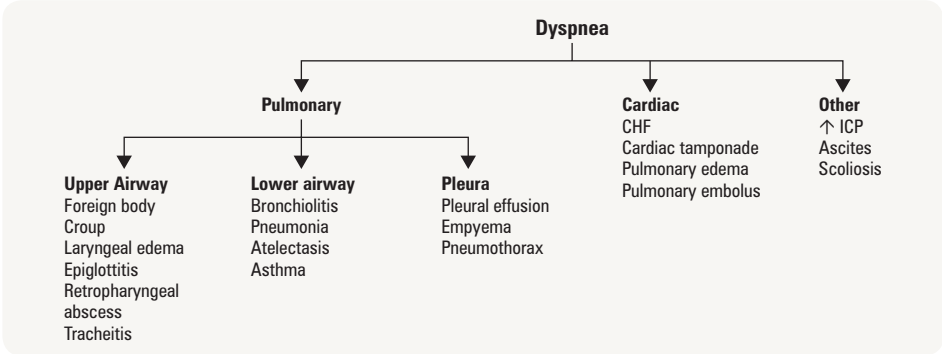

Figure 16. Approach to dyspnea in childhood

## Upper Respiratory Tract Diseases

- see [Otolaryngology](#), OT44
- diseases above the thoracic inlet characterized by inspiratory stridor, hoarseness, and suprasternal retractions
- differential diagnosis of stridor: croup, bacterial tracheitis, epiglottitis, foreign body aspiration, subglottic stenosis (congenital or iatrogenic), laryngomalacia/tracheomalacia (collapse of airway cartilage on inspiration)

Table 44. Common Upper Respiratory Tract Infections in Children

	Croup (Laryngotracheobronchitis)	Bacterial Tracheitis	Epiglottitis
Anatomy	Subglottic laryngitis	Subglottic tracheitis	Supraglottic laryngitis
Epidemiology	Common in children <6 yr, with peak incidence between 7-36 mo Common in fall and early winter	Rare All age groups	Very rare – due to Hib vaccination Usually older (2-6 yr)
Etiology	Parainfluenza (75%) Influenza A and B RSV Adenovirus	<i>S. aureus</i> <i>H. influenzae</i> $\alpha$ -hemolytic strep Pneumococcus <i>Moraxella catarrhalis</i>	<i>H. influenzae</i> $\beta$ -hemolytic strep
Clinical Presentation	Common Prodrome: rhinorrhea, pharyngitis, cough, $\pm$ low-grade fever Symptoms: Hoarse voice Barking cough Stridor Worse at night	Similar symptoms as croup but more rapid deterioration with high fever Toxic appearance Does not respond to croup treatments	Toxic appearance Rapid progression 4 Ds – drooling, dysphagia, dysphonia, distress Stridor Tripod position Sternal recession Anxious Fever ( $>39^{\circ}\text{C}$ )
Investigations	Clinical diagnosis CXR in atypical presentation: “steep sign” from subglottic narrowing	Clinical diagnosis Endoscopy: definitive diagnosis	Clinical diagnosis Avoid examining the throat to prevent further respiratory exacerbation
Treatment	No evidence for humidified $\text{O}_2$ Dexamethasone: PO 1 dose Racemic epinephrine: nebulized, 1-3 doses, q1-2h Intubation if unresponsive to treatment	Usually requires intubation IV antibiotics	Intubation Antibiotics Prevented with Hib vaccine

## Lower Respiratory Tract Diseases

- obstruction of airways below thoracic inlet, produces more expiratory sounds
- classic symptom: wheezing

### Differential Diagnosis of Wheezing

- common
  - asthma: recurrent wheezing episodes, identifiable triggers; typically over 6 yr
  - bronchiolitis: first episode of wheezing; usually under 1 yr
  - recurrent aspiration: often neurological impairment
  - pneumonia: fever, cough, malaise
- uncommon
  - foreign body: acute unilateral wheezing and coughing
  - cystic fibrosis: prolonged wheezing, unresponsive to therapy
  - bronchopulmonary dysplasia: often develops after prolonged ventilation in the newborn
- rare
  - congestive heart failure
  - mediastinal mass
  - bronchiolitis obliterans
  - tracheobronchial anomalies

## Pneumonia

### Etiology

- inflammation of pulmonary tissue, associated with consolidation of alveolar spaces

### Clinical Presentation

- incidence is greatest in first year of life with viral cause being most common in children <5 yr
- cough, wheeze, stridor
- CXR: diffuse, streaky infiltrates bilaterally
- bacterial causes may present with cough, fever, chills, dyspnea, more dramatic CXR changes (e.g. lobar consolidation, pleural effusion)

### Management

- see Table 45
- supportive therapy: hydration, antipyretics, humidified O<sub>2</sub>

**Table 45. Common Causes and Treatment of Pneumonia at Different Ages**

Age	Bacterial	Viral	Atypical Bacteria	Treatment
Neonates	GBS <i>E. coli</i> <i>Listeria</i>	CMV Herpes virus Enterovirus	<i>Mycoplasma hominis</i> <i>Ureaplasma urealyticum</i>	ampicillin + gentamicin / tobramycin (add erythromycin if suspect <i>Chlamydia</i> )
1-3 months	<i>S. aureus</i> <i>H. influenzae</i> <i>S. pneumoniae</i> <i>B. pertussis</i>	CMV, RSV Influenza virus Parainfluenza virus	<i>Chlamydia trachomatis</i> <i>Ureaplasma</i>	cefuroxime OR ampicillin ± erythromycin OR clarithromycin
3 months – 5 years	<i>S. pneumoniae</i> <i>S. aureus</i> <i>H. influenzae</i> GAS	RSV Adenovirus Influenza virus	<i>M. pneumoniae</i> , TB	amoxicillin (if mild) OR ampicillin OR cefuroxime
>5 years	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>S. aureus</i>	Influenza virus Varicella Adenovirus	<i>Mycoplasma pneumoniae</i> (most common) <i>Chlamydia pneumoniae</i> TB <i>Legionella pneumophila</i>	erythromycin OR clarithromycin (1st line) OR ampicillin OR cefuroxime

## Bronchiolitis

### Definition

- LRTI that has wheezing and signs of respiratory distress

### Epidemiology

- the most common LRTI in infants, affects 50% of children in first 2 yr of life; peak incidence at 6 mo, winter or early spring
- increased incidence of asthma in later life

### Etiology

- respiratory syncytial virus (RSV) (>50%), parainfluenza, influenza, rhinovirus, adenovirus, *M. pneumoniae* (rare)

### Clinical Presentation

- prodrome of URTI with cough and fever
- feeding difficulties, irritability
- wheezing, respiratory distress, tachypnea, tachycardia, retractions, poor air entry lasting for 5-6 d

### Investigations

- CXR (only in severe disease, poor response to therapy, chronic episode)
  - air trapping, peribronchial thickening, atelectasis, increased linear markings
- nasopharyngeal swab
  - direct detection of viral antigen (immunofluorescence)
- WBC can be normal

### Treatment

- self-limiting disease with symptoms usually lasting 2-3 wk
- mild distress
  - supportive: oral or IV hydration, antipyretics for fever, O<sub>2</sub>
- moderate to severe distress
  - as above ± intubation and ventilation as needed
  - consider rebetol (Ribavirin®) in high risk groups: bronchopulmonary dysplasia, CHD, congenital lung disease, immunodeficient
- monthly RSV-Ig or palivizumab (monoclonal antibody against the F-glycoprotein of RSV) is protective against severe disease in high risk groups; case fatality rate <1%
- antibiotics have no therapeutic value unless there is secondary bacterial pneumonia
- indications for hospitalization:
  - hypoxia: O<sub>2</sub> saturation <92% on initial presentation
  - persistent resting tachypnea >60/min and retractions after several salbutamol masks
  - past history of chronic lung disease, hemodynamically significant cardiac disease, neuromuscular problem, immunocompromised
  - young infants <6 mo old (unless extremely mild)
  - significant feeding problems
  - social problem (e.g. inadequate care at home)

#### Bronchodilators for Bronchiolitis

*Cochrane DB Syst Rev 2010;12:CD001266*

**Study:** Meta-analysis of prospective, randomized, double-blinded, placebo-controlled trials.

**Patients:** 1912 infants (28 trials) up to 24 mo old with bronchiolitis.

**Intervention:** Bronchodilators (including albuterol, salbutamol, terbutaline, ipratropium bromide, and adrenergic agents) given oral, subcutaneous, or nebulized vs. placebo.

**Main outcome:** Oxygen saturation.

**Results:** No clinically significant difference for infants treated with bronchodilators vs. placebo for bronchiolitis. Given the costs and side effects it is not recommended to use bronchodilators as management for bronchiolitis in infants.

Children with bronchiolitis do not respond to ipratropium (Atrovent®) or steroids.

## Asthma

### Definition

- see [Respirology](#), R6
- characterized by recurrent episodes of airway hyperreactivity, bronchospasm and inflammation; reversible small airway obstruction
- very common, presents most often in early childhood
- associated with other atopic diseases such as allergic rhinitis or atopic dermatitis

### Clinical Presentation

- episodic bouts of wheezing, dyspnea, tachypnea, cough (usually at night/early morning, with activity or cold exposure)
- physical exam may reveal hyper-resonant chest, prolonged expiration, wheeze

### Triggers

- URTI (viral or *Mycoplasma*), weather (cold exposure, humidity changes), allergens (pets), irritants (cigarette smoke), exercise, emotional stress, drugs (Aspirin®, β-blockers)

### Classification

- mild asthma
  - occasional attacks of wheezing or coughing (<2/wk)
  - symptoms respond quickly to inhaled bronchodilator
  - never needs systemic corticosteroids
- moderate asthma
  - more frequent episodes with symptoms persisting and chronic cough
  - decreased exercise tolerance
  - sometimes needs systemic corticosteroids
- severe asthma
  - daily and nocturnal symptoms
  - frequent ER visits and hospitalizations
  - usually needs systemic corticosteroid

## Management

- acute
  - O<sub>2</sub> (keep O<sub>2</sub> saturation >92%) and fluids if dehydrated
  - β<sub>2</sub>-agonists: salbutamol (Ventolin®) 0.03 cc/kg (max 1 cc) in 3 cc NS q20min by mask until improvement, then masks hourly if necessary
  - ipratropium bromide (Atrovent®) if severe: 1 cc added to each of first 3 salbutamol masks
  - steroids: prednisone (2 mg/kg in ER, then 1 mg/kg daily x 4 d) or dexamethasone (0.3 mg/kg/d); in severe disease, use IV steroids
  - continue to observe- can discharge patient if asymptomatic for 2-4 h after last dose
- chronic
  - education, emotional support, avoid allergens or irritants, develop an “action plan”
  - exercise program (e.g. swimming)
  - monitor respiratory function with peak flow meter (improves self-awareness of status)
  - PFTs for children >6 yr
  - reliever therapy: short acting β<sub>2</sub>-agonists (e.g. salbutamol)
  - controller therapy (first line therapy for all children): low dose daily inhaled corticosteroids
  - second line therapy for children <12 yr: moderate dose of daily inhaled corticosteroids
  - second line therapy for children >12 yr: antileukotriene OR long acting β<sub>2</sub>-agonist in conjunction with low dose inhaled corticosteroids
    - ♦ leukotriene receptor antagonist monotherapy may be considered an alternative second line therapy
  - severe asthma unresponsive to first and second line treatments injection immunotherapy
  - aerochamber for children using daily inhaled corticosteroids
- indications for hospitalization
  - pre-treatment O<sub>2</sub> saturation <92%
  - past history of life-threatening asthma (ICU admission)
  - unable to stabilize with masks q4h
  - concern over environmental issues or family's ability to cope

### Canadian Paediatric Asthma Consensus Guidelines for assessing adequate control of asthma:

- Daytime symptoms <4 d/wk
- Night time symptoms <1 night/wk
- Normal physical activity
- Mild and infrequent exacerbations
- No work/school absenteeism
- Need for β-agonist <4 doses/wk
- FEV<sub>1</sub> or peak expiratory flow ≥90% of personal best
- Peak expiratory flow diurnal variation <10 to 15%

## Cystic Fibrosis (CF)

- see [Respirology](#), R11

### Etiology

- 1 per 3000 live births, mostly Caucasians
- autosomal recessive, *CFTR* gene found on chromosome 7 (ΔF508 mutation in 70%, but >1600 different mutations identified) resulting in a dysfunctional chloride channel on the apical membrane of cells
- leads to relative dehydration of airway secretions, resulting in impaired mucociliary transport and airway obstruction
- in Ontario, CF is routinely screened in the newborn

### Clinical Presentation

- neonatal
  - meconium ileus
  - prolonged jaundice
  - antenatal bowel perforation
- infancy
  - pancreatic insufficiency with steatorrhea and failure to thrive (despite voracious appetite)
  - anemia, hypoproteinemia, hyponatremia
- childhood
  - heat intolerance
  - wheezing or chronic cough
  - recurrent chest infections (*S. aureus*, *P. aeruginosa*, *H. influenzae*)
  - hemoptysis
  - nasal polyps
  - distal intestinal obstruction syndrome, rectal prolapse
  - clubbing of fingers
- older patients
  - chronic obstructive pulmonary disease
  - infertility (males); decreased fertility (female)

### Investigations

- sweat chloride test x 2 (>60 mEq/L)
  - false positive tests: malnutrition, atopic dermatitis, hypothyroidism, hypoparathyroidism, glycogen storage disease type, adrenal insufficiency, G6PD, Klinefelter syndrome, technical issues, autonomic dysfunction, familial cholestasis syndrome
  - false negative tests: technical problem with test, malnutrition, skin edema, mineralocorticoids

### CF Presenting Signs

#### CF PANCREAS

- Chronic cough and wheezing
- Failure to thrive
- Pancreatic insufficiency (symptoms of malabsorption like steatorrhea)
- Alkalosis and hypotonic dehydration
- Neonatal intestinal obstruction (meconium ileus)/Nasal polyps
- Clubbing of fingers/Chest radiograph with characteristic changes
- Rectal prolapse
- Electrolyte elevation in sweat, salty skin
- Absence or congenital atresia of vas deferens
- Sputum with *Staph* or *Pseudomonas* (mucoid)
- Pancreatic dysfunction – determined by 3 d fecal fat collection
- Genetics – useful where sweat chloride test is equivocal

## Management

- nutritional counselling
  - high calorie diet, pancreatic enzyme replacements, fat soluble vitamin supplements
- management of chest disease
  - physiotherapy, postural drainage
  - exercise
  - bronchodilators
  - aerosolized DNAase and inhaled hypertonic saline
  - antibiotics: depends on sputum C&S (e.g. cephalosporin, cloxacillin, ciprofloxacin, inhaled tobramycin)
  - lung transplantation
- genetic counselling

## Complications

- respiratory failure, pneumothorax (poor prognostic sign), cor pulmonale (late), pancreatic fibrosis with diabetes mellitus, gallstones, cirrhosis with portal hypertension, infertility (male)
- early death (current median survival in Canada is 46.6 yr)

# Rheumatology

## Evaluation of Limb Pain

**Table 46. Differential Diagnosis of Limb Pain**

Cause	<3 yr	3-10 yr	>10 yr
<b>Trauma</b>	x	x	x
<b>Infectious</b>			
Septic arthritis	x	x	x
Osteomyelitis	x	x	x
<b>Inflammatory</b>			
Transient synovitis	x	x	
JIA	x	x	x
Spondyloarthritis		x	x
SLE		x	x
Dermatomyositis		x	x
HSP		x	x
<b>Anatomic/Orthopedic</b>			
Legg-Calve-Perthes disease		x	x
Slipped capital femoral epiphysis			x
Osgood-Schlatter disease			x
<b>Neoplastic</b>			
Leukemia	x	x	x
Neuroblastoma	x	x	x
Bone tumour		x	x
<b>Hematologic</b>			
Hemophilia (hemarthrosis)	x	x	x
Sickle cell anemia	x	x	x
<b>Pain Syndromes</b>			
Growing pains		x	x
Fibromyalgia		x	x
Reflex sympathetic dystrophy			x

### Red Flags for Limb Pain

Fever, pinpoint pain/tenderness, pain out of proportion to degree of inflammation, night pain, weight loss, erythema.

- must rule out infection, malignancy or an acute orthopedic condition

## History

- limp/weight-bearing status
- morning stiffness
- systemic symptoms (fever, rash, weight loss, fatigue)
- past medical illness, intercurrent infection, travel, sick contact history
- family history (arthritis, bleeding disorders, sickle cell anemia, IBD, psoriasis)

**Physical**

- joint exam (swelling, erythema, warmth, tenderness, deformity, ROM)
- adjacent structures (bone, tendon, muscle, skin)
- gait
- leg length
- neurologic exam

**Investigations**

- basic: CBC and differential, blood smear, ESR, CRP, x-ray
- as indicated: blood (ANA, RF, culture, viral/bacterial serology, CK, PTT, sickle cell screen, immunoglobulins, complement), urinalysis, synovial fluid (cell count, Gram stain, culture), TB skin test, imaging, BM aspiration, slit lamp exam

## Growing Pains

**Epidemiology**

- age 2-12 yr, M=F

**Clinical Presentation**

- diagnosis of exclusion
- intermittent, non-articular pain in childhood with *normal physical exam findings*
- pain at night, often limited to the calf, shin or thigh; typically short-lived and bilateral
- relieved by heat, massage, mild analgesics
- child is well, asymptomatic during the day, no functional limitation
- possible family history of growing pains

**Management**

- lab investigations not necessary if typical presentation; reassurance and supportive management

## Transient Synovitis of the Hip

- benign, self limited disorder, usually occurs after upper respiratory tract infection, pharyngitis, otitis media

**Epidemiology**

- age 3-10 yr, M>F

**Clinical Presentation**

- afebrile or low-grade fever, pain typically occurs in hips, knees (referred from hip); painful limp but capable of moving hip through ROM (pain not as pronounced as in joint or bone infections)
- symptoms resolve over 7-10 d

**Investigations**

- WBC within normal limits; ESR and CRP may be mildly elevated
- joint effusions may be seen on imaging
- diagnosis of exclusion (r/o septic arthritis and osteomyelitis)

**Treatment**

- symptomatic and anti-inflammatory medications

## Septic Arthritis

- **MEDICAL EMERGENCY**
- see [Orthopedics](#), ORI0

**Table 47. Microorganisms Involved in Septic Arthritis/Osteomyelitis**

Age	Pathogens	Treatment
Neonate	GBS, <i>S. aureus</i> , GNB	cloxacillin + aminoglycoside or cefotaxime
Infant (1-3 mo)	<i>Strep. sp.</i> , <i>Staph. sp.</i> , <i>H. influenzae</i> Pathogens as per neonate	cloxacillin + cefotaxime
Child	<i>S. aureus</i> , <i>S. pneumoniae</i> , GAS	cefazolin
Adolescent	As above; also <i>N. gonorrhoeae</i>	cefazolin
Sickle cell disease	As above; also <i>Salmonella</i>	cefotaxime

GBS = group B Strep; GNB = Gram-negative bacilli; GAS = group A Strep

Adapted from Tse SML, Laxer RM. Pediatrics in Review 2006;27:170-179

## Juvenile Idiopathic Arthritis (JIA)

- a heterogeneous group of conditions characterized by persistent arthritis in children <16 yr
- arthritis defined:
  1. joint swelling/effusion OR
  2. >2 of the following:
    - ♦ decreased range of motion
    - ♦ tenderness or pain on motion
    - ♦ increased warmth
- diagnosis
  - arthritis in ≥1 joint(s)
  - duration ≥6 wk
  - onset age <16 yr old
  - with exclusion of other causes of arthritis
  - classification defined by features/number of joints affected in the first 6 mo of onset

### Systemic Arthritis (Still's disease)

- onset at any age, M=F
- once or twice daily fever spikes ( $>38.5^{\circ}\text{C}$ )  $\geq 2$  wk; children usually acutely unwell during fever episodes
- extra-articular features: erythematous "salmon-coloured" maculopapular rash, lymphadenopathy, hepatosplenomegaly, leukocytosis, thrombocytosis, anemia, serositis
- arthritis may occur weeks to months later
- high ESR, CRP, WBC, platelet count

### Oligoarticular Arthritis (arthritis of 1-4 joints)

- onset early childhood, F>M
- persistent: affects no more than 4 joints during the disease course
- extended: affects more than 4 joints after the first six months
- typically affects large joints: knees > ankles, elbows, wrists; hip involvement unusual
- ANA positive ~60-80%, rheumatoid factor (RF) negative
- screening eye exams for asymptomatic anterior uveitis (occurs in ~30%)
- complications: knee flexion contracture, quadriceps atrophy, leg-length discrepancy, growth disturbances

### Polyarticular Arthritis (arthritis of 5 or more joints)

- RF negative
  - onset: 2-4 yr and 6-12 yr, F>M
  - symmetrical involvement of large and small joints of hands and feet, TMJ, cervical spine
- RF positive
  - onset: late childhood/early adolescence, F>M
  - similar to the aggressive form of adult rheumatoid arthritis
  - severe, rapidly destructive, symmetrical arthritis of large and small joints
  - may have rheumatoid nodules at pressure points (elbows, knees)
  - unremitting disease, persists into adulthood

### Enthesitis-Related Arthritis

- onset: late childhood/adolescence, M>F
- arthritis and/or enthesitis
- weight bearing joints, especially hip and intertarsal joints
- risk of developing ankylosing spondylitis in adulthood

### Psoriatic Arthritis

- onset: 2-4 yr and 9-11 yr, F>M
- arthritis and psoriasis OR arthritis and at least two of:
  - dactylitis, nail abnormalities, or family history of psoriasis in a 1st degree relative
  - asymmetric or symmetric small or large joint involvement

### Undifferentiated

- arthritis of unknown cause that persists for 6 wk and either does not fulfill criteria for any category or fulfills criteria for more than one category

### Management

- goals of therapy: eliminate inflammation, prevent joint damage, promote normal growth and development as well as normal function, minimize medication toxicity
- exercise to maintain range of motion (ROM) and muscle strength
- multidisciplinary approach: OT/PT, social work, orthopedics, ophthalmology, rheumatology
- 1st line drug therapy: NSAIDs, intra-articular corticosteroids

- 2nd line drug therapy:
  - DMARDs: methotrexate, sulfasalazine, leflunamide
  - corticosteroids: acute management of severe arthritis, systemic symptoms of JIA, topical eye drops for uveitis
  - biologic agents

## Reactive Arthritis

- see [Rheumatology](#), RH23
- arthritis (typically the knee) follows bacterial infection especially with *Salmonella*, *Shigella*, *Yersinia*, *Campylobacter*, *Chlamydia*, and most commonly *Streptococcus* (post-streptococcal reactive arthritis)
- typically resolves spontaneously
- may progress to chronic illness or Reiter's syndrome (urethritis, conjunctivitis)

## Lyme Arthritis

- see [Infectious Diseases](#), ID26
- caused by spirochete *Borrelia burgdorferi*
- incidence highest among 5-10 yr olds
- do not treat children <8 yr old with doxycycline (may cause permanent tooth discolouration)

## Systemic Lupus Erythematosus (SLE)

- see [Rheumatology](#), RH11
- autoimmune illness affecting multiple organ systems
- incidence 1 per 1000, more commonly age >10, F:M = 10:1
- childhood-onset SLE vs. adult-onset SLE:
  - children have more active disease
  - children are more likely to have renal disease
  - children receive more intensive drug therapy and sustain more damage

## Vasculitides

### HENOCH-SCHÖNLEIN PURPURA (HSP)

- most common vasculitis of childhood, peak incidence 4-10 yr, M:F = 2:1
- vasculitis of small vessels
- often have history of URTI 1-3 wk before onset of symptoms

### Clinical Presentation

- clinical triad: 1) palpable purpura, 2) abdominal pain, 3) arthritis
- skin: palpable, non-thrombocytopenic purpura in lower extremities and buttocks, edema, scrotal swelling
- joints: arthritis/arthralgia involving large joints associated with painful edema
- GI: abdominal pain, GI bleeding, intussusception
- renal: microscopic hematuria, IgA nephropathy, proteinuria, hypertension, renal failure in <5%

### Management

- mainly supportive
- anti-inflammatories for joint pain, corticosteroids for select patients
- monitor for protein on urinalysis every month for 6 mo, checking for renal disease, which may develop late (immunosuppressive therapy if severe)

### Prognosis

- self-limited, resolves within 4 wk
- recurrence in about one third of patients
- long term prognosis dependent on severity of nephritis

## KAWASAKI DISEASE

- acute vasculitis of unknown etiology (likely triggered by infection)
- medium-sized vasculitis with predilection for coronary arteries
- most common cause of acquired heart disease in children in developed countries
- peak age: 3 mo – 5 yr; Asians > Blacks > Caucasians

### Diagnostic Criteria

- fever persisting 5 d or more AND
- 4 of the following features:
  1. bilateral conjunctival injection
  2. red infected fissured lips, strawberry tongue, injected pharynx
  3. changes of the peripheral extremities
    - ♦ acute phase: peripheral edema, peripheral erythema
    - ♦ subacute phase: peeling from tips of fingers and toes
  4. polymorphous rash
  5. cervical lymphadenopathy >1.5 cm in diameter
- exclusion of other diseases (e.g. scarlet fever, measles)
- atypical Kawasaki disease: less than 5 of 6 diagnostic features but coronary artery involvement

### Management

- high (anti-inflammatory) dose of ASA while febrile
- low (anti-platelet) dose of ASA in subacute phase until platelets normalize or longer if coronary artery involvement
- IV immunoglobulin (2 g/kg) within 10 d of onset reduces risk of coronary aneurysm formation
- baseline 2D-ECHO and follow up periodic 2D-ECHO (usually at 6 wk)

### Complications

- coronary artery vasculitis with aneurysm formation occurs in 20-25% of untreated children, <5% if receive IVIG within 10 d of fever
- 50% of aneurysms regress within 2 yr
- anticoagulation for multiple or large coronary aneurysms
- risk factors for coronary disease: male, age <1 or >9 yr, fever >10 d, Asian or Hispanic ethnicity, thrombocytopenia, hyponatremia

#### Diagnostic Criteria for Kawasaki Disease

Warm CREAM  
 Fever ≥5 d  
 Conjunctivitis  
 Rash  
 Edema/Erythema (hands and feet)  
 Adenopathy  
 Mucosal involvement

## Common Medications

**Table 48. Commonly Used Medications in Pediatrics**

Drug Name	Dosing Schedule	Indications	Comments
acetaminophen (Tylenol®)	10-15 mg/kg/dose PO q4-6h prn	Analgesic, antipyretic	Not to exceed 60 mg/kg/d or 4 g/d Causes hepatotoxicity at high doses
amoxicillin (Amoxil®)	80-90 mg/kg/d PO divided q8h	Otitis media	
dexamethasone	0.6 mg/kg PO x 1 0.3 mg/kg/d PO for 5 d	Croup Acute asthma	
fluticasone (Flovent®)	moderate dose – 250-500 µg/d divided bid high dose – >500 µg/d divided bid	Asthma	
ibuprofen (Advil®)	5-10 mg/kg/dose PO q6-8h	Analgesic, antipyretic	Cautious use in patients with liver impairment, history of GI bleeding or ulcers
iron	6 mg/kg/d elemental iron OD or divided tid	Anemia	SE: dark stool, constipation, dark urine
omeprazole		GERD	SE: headache, diarrhea, nausea, abdominal pain
ondansetron		Post-op nausea and vomiting, gastroenteritis, cyclic vomiting	SE: QTc prolongation, orally disintegrating tablets contain phenylalanine (caution in phenylketonuria patients)
phenobarbital	3-5 mg/kg/d PO OD or bid	Seizures	SE: CNS depression
polyethylene glycol 3350 (PEG)	Disimpaction: 1-1.5 g/kg/d for 3 d Maintenance: Starting dose at 0.4-1 g/kg		

**Table 48. Commonly Used Medications in Pediatrics** (continued)

Drug Name	Dosing Schedule	Indications	Comments
prednisone	1-2 mg/kg/d PO x 5 d	Asthma	Oral prednisone is bitter tasting, consider using prednisilone
prednisilone	3-4 mg/kg/d PO then taper to 1-2 mg/kg/d	ITP	
	PO once platelet count >30 x 10 <sup>9</sup> /L	Nephrotic syndrome	
	60 mg/m <sup>2</sup> /d PO		
salbutamol (Ventolin®)	0.01-0.03 mL/kg/dose in 3 mL normal saline via nebulizer q1/2-4h pm	Acute asthma	Can cause tachycardia, hypokalemia, restlessness
	100-200 µg/dose pm, max 4-8 puffs frequency q4h	Maintenance treatment or asthma

**Skin Lesions and Masses**

**DDx of Skin Lesions/Masses**

- for background information and medical management, see [Dermatology](#)
- for biopsy techniques, see PL7

**Surgical Management of Malignant Skin Lesions**

- surgical treatment for all malignant skin lesions involve total excision of the primary lesion
- excision margin of lesion depends on the diameter and depth
- for decisions regarding reconstruction using flaps or skin grafts, see *Reconstruction*, PL11

**Precursors of Malignant Lesions**

Table 1. Precursors

Basal Cell Carcinoma	Squamous Cell Carcinoma	Malignant Melanoma
No known precursor	Actinic keratosis Bowen's disease Bowenoid papulosis Paget's disease Leukoplakia Erythroplasia	Dysplastic nevus Lentigo maligna Giant congenital nevus

**Surgical Margins**

Table 2. Surgical Margins for Basal Cell Carcinoma

Diameter of Lesion	Surgical Margins
2 cm or less	3 mm
>2 cm	5 mm

Table 3. Surgical Margins for Squamous Cell Carcinoma

Diameter or Location of Lesion	Surgical Margins
2 cm or less*	4 mm*
>2 cm	6 mm
High risk (facial)	6 mm
Low risk (elsewhere)	4 mm

\*For a high risk lesion that is <2 cm in diameter, use a 6 mm margin

**Table 4. Surgical Margins for Malignant Melanoma**

Depth of Lesion	Surgical Margins
In situ	0.5 cm
<1 mm	1 cm
1.01-1.99 mm	1-2 cm
≥2 mm	2 cm

Traumatic tattoos are permanent discolorations resulting from new skin growth over foreign material or dirt left behind in the dermis. Copious irrigation should be done ASAP.

## Basic Surgical Techniques

### Sutures and Suturing

#### ANESTHESIA

- debride and irrigate before injecting anesthetic
- toxicity of mixtures (i.e. lidocaine + bupivacaine) is no greater than its individual components

**Table 5. Toxic Limit and Duration of action (1 cc of 1% solution contains 10 mg lidocaine)**

	Without Epinephrine	With Epinephrine (vasoconstrictor, limits bleeding)
Lidocaine (Xylocaine®)	5 mg/kg, lasts 45-60 min	7 mg/kg, lasts 2-6 h
Bupivacaine (Marcaine®) for longer analgesic effect	2 mg/kg, lasts 2-4 h	3 mg/kg, lasts 3-7 h

#### IRRIGATION AND DEBRIDEMENT

- irrigate copiously with a physiologic solution such as Ringer's lactate or normal saline to remove surface clots, foreign material, and bacteria
- debride all obviously devitalized tissue, irregular or ragged wounds must be excised to produce sharp wound edges that will assist healing when approximated

#### SUTURES

- use of a particular suture material is highly dependent on surgeon preference. However, skin should be closed with a non absorbable when trauma
- suture material divided by two categories (see Table 6)

**Table 6. Suture Materials: Absorbable vs. Non-absorbable and Monofilament vs. Multifilament**

Suture Materials	Uses	Examples	Notes
Absorbable	Deep sutures under short-term tension Skin closure in children	Plain gut®, Vicryl®, Polysorb®	loses at least 50% of their strength in 4 wk; eventually absorbed
Non-absorbable	Skin closure Sites of long term tension	Nylon, polypropylene, stainless steel	Lower likelihood of wound dehiscence
Monofilament	Contaminated and infected wounds (lower likelihood of bacterial trapping in suture material)	Monosof®, Monocryl®, Biosyn®	Slides through tissue with less friction; more memory/stiffness
Multifilament	AVOID in contaminated wounds (increased likelihood of bacterial trapping)	Vicryl® and Silk	Less memory/stiffness thus easier to work with

### BASIC SUTURING TECHNIQUES

#### Basic Suture Methods (Figure 12)

- simple interrupted: can be used in almost all situations
- sub-cuticular: good cosmetic result but weak, used in combination with deep sutures; not used in trauma
- vertical mattress: for areas difficult to evert (e.g. dorsum of the hand)
- horizontal mattress: everting, time saving
- continuous over and over (aka "running", "baseball stitch"): time saving, good for hemostasis

#### Basic Principles

- minimize tissue trauma: follow curve of needle, handle wound edges gently (use toothed forceps), use just enough tension to approximate edges (do not strangulate)
- use the finest needle and suture possible
- ensure good cosmesis (see sidebar)

**Simple Interrupted****Sub-cuticular****Horizontal Mattress****Vertical Mattress****Deep Dermal**

© Baseer Khan, Tabby Lutham 2010

**Figure 12. Basic suture methods**

#### Steps to Ensuring Good Suturing Cosmesis:

- Incisions should be made along relaxed skin tension lines
- Attain close apposition of wound edges
- Minimize tension on skin by closing in layers
- Evert wound edges
- Use appropriately sized suture for skin closure (5-0, 6-0 on face; 3-0, 4-0 elsewhere)
- Ensure equal width and depth of tissue on both sides
- Remove sutures within 5-7 d from the face, 10-14 d from scalp/torso/ extremities

### Other Skin Closure Materials

- tapes: may be indicated for superficial wounds and those with opposable edges. Tape cannot be used on actively bleeding wounds. When placed across the incision, will prevent surface marks and can be used primarily or after surface sutures have been removed. Tape burns may occur if there is excessive tension or swelling around the incision
- skin adhesives: e.g. 2-octylcyanoacrylate (e.g. Dermabond®) works well on small areas without much tension or shearing. May cause irreversible tattooing
- staples: steel-titanium alloys that incite minimal tissue reaction (healing is comparable to wounds closed by suture)

## Excision

- incise along relaxed skin tension lines to minimize appearance of scar (Figure 13)
- use elliptical incision to prevent “dog ears” (heaped up skin at end of incision)
- if needed, undermine skin edges to decrease wound tension
- use layered closure including dermal sutures when wound is deeper than superficial (decreases tension)

## Skin Biopsy Types and Techniques

### SHAVE BIOPSY

- used for superficial lesions where sampling of the full thickness of the dermis is not necessary
- most suitable lesions for shave biopsies are either elevated above the skin or have pathology confined to the epidermis (e.g. seborrheic or actinic keratoses, skin tags, warts, and superficial basal cell or squamous cell carcinomas)
- rapid, requires little training, and does not require sutures for closure
- should not be used for pigmented lesions – an unsuspected melanoma cannot be properly staged if partially removed

### PUNCH BIOPSY

- involves the removal of a core-shaped piece of tissue, performed with round, disposable knives ranging in diameter from 2 to 10 mm
- allows sampling of the deep dermis
- can be used for the diagnosis and treatment of small pigmented lesions and atypical moles
- punch biopsy wounds can be closed with suture or left to heal by secondary intention. Punches greater than 3 mm may produce scarring and are best closed with one or two sutures
- has low incidence of infection, bleeding, nonhealing, significant scarring

### EXCISIONAL BIOPSY

- performed for lesions that require complete removal for diagnostic or therapeutic purposes
- performed for lesions that cannot be adequately punch biopsied due to size, depth, or location
- requires the greatest amount of expertise and time
- always requires sutures for closure

### TECHNIQUE

#### General

- all biopsies performed in clinic are done using aseptic technique, but are not sterile
- sterile gloves are indicated for biopsies and excisions in all patients

#### Preparing the Site

- common skin antiseptics (betadine, chlorhexidine) can be used to prepare the biopsy site
- chlorhexidine is used in concentrations ranging from 0.5-4%. This higher concentration cannot be used on the face as it could get into the eyes and may burn or cause damage
- mark the intended lesion and surgical margins with a surgical marker since they may be temporarily obliterated following injection of the anesthetic
- for all biopsies, a sterile drape technique is indicated. A fenestrated surgical drape is placed around the biopsy site after the area is cleansed and anesthetized

#### Anesthesia

- most commonly used local anesthetic is 1% or 2% lidocaine
- small amounts of epinephrine are added to constrict blood vessels, decrease bleeding, prolong anesthesia, and limit lidocaine toxicity. The local with epinephrine can be injected directly into the lesion
- local anesthetics with epinephrine may be used anywhere in the body including the digits
- epinephrine should be avoided in patients with history of vascular compromise
- a field block should be performed for larger lesions by placing a ring of anesthetic around the surgical site, advancing and injecting through a site that has been previously anesthetized

**Figure 13. Incision of lesions along relaxed skin tension lines**

#### Relaxed Skin Tension Lines

Natural skin/wrinkle lines with minimal linear tension. Placing incisions parallel to relaxed skin tension lines minimizes widening/hypertrophy, and helps to camouflage scars.

# Wounds

## Causal Conditions

- laceration: cut or torn tissue
- abrasion: superficial skin layer is removed, variable depth
- contusion: injury caused by forceful blow to the skin and soft tissue; entire outer layer of skin intact yet injured
- avulsion: tissue/limb forcefully separated from surrounding tissue, either partially or fully; “de-gloving”
- puncture wounds: opening relatively small as compared with depth (e.g. needle)
  - includes bite wounds
- crush injuries: caused by compression
- thermal and chemical wounds

## Principles of Wound Healing

- wound: disruption of the normal anatomical relationships of tissue as a result of injury

### STAGES OF WOUND HEALING

- see Figure 14
- growth factors released by tissues play an important role
- scar is mature once it has completed the final stage

### FACTORS INFLUENCING WOUND HEALING

#### Local (reversible/controllable):

- mechanical (local trauma, tension)
- blood supply (ischemia/circulation)
- temperature
- technique and suture materials
- retained foreign body
- infection
- hematoma/seroma (↑ infection rate)
- venous hypertension
- peripheral vascular disease

#### General (often irreversible):

- age
- nutrition (protein, vitamin C, O<sub>2</sub>)
- smoking
- chronic illness (e.g. diabetes, cancer, CVD)
- immunosuppression (steroids, chemo, radiation)
- collagen vascular disease
- tissue irradiation

Myofibroblasts are the cells responsible for wound contraction. They do this at a rate of less than 0.75 mm/d.

PHASE	PROCESS
<b>1. Inflammatory Phase (Reactive) (Days 1-6)</b> <ul style="list-style-type: none"> <li>• Limits damage, prevents further injury</li> <li>• Debris and organisms cleared via inflammatory response:               <ul style="list-style-type: none"> <li>• Neutrophils (24-48 h)</li> <li>• Macrophages: critical to wound healing by orchestrating growth factors for collagen production (48-96 h)</li> <li>• Lymphocytes: role poorly defined (5-7 d)</li> </ul> </li> </ul>	→ <ol style="list-style-type: none"> <li>1. Hemostasis – vasoconstriction + platelet plug</li> <li>2. Chemotaxis – migration of macrophages and PMN</li> </ol>
<b>2. Proliferative Phase (Regenerative) (Day 4 – Week 3)</b> <ul style="list-style-type: none"> <li>• Fibroblasts attracted and activated by macrophage growth factors</li> <li>• Reparative process: re-epithelialisation, matrix synthesis, angiogenesis (relieves ischemia)</li> <li>• Tensile strength begins to increase at days 4-5</li> </ul>	→ <ol style="list-style-type: none"> <li>1. Collagen synthesis (mainly type III)</li> <li>2. Angiogenesis</li> <li>3. Epithelialization</li> </ol>
<b>3. Remodeling Phase (Maturation) (Week 3 – 1 year)</b> <ul style="list-style-type: none"> <li>• Increasing collagen organization and stronger crosslinks</li> <li>• Type I collagen replaces Type III until normal 4:1 ratio achieved</li> <li>• Peak tensile strength at 60 d – 80% of preinjury strength</li> </ul>	→ <ol style="list-style-type: none"> <li>1. Contraction</li> <li>2. Scarring</li> <li>3. Remodeling of scar</li> </ol>

Figure 14. Stages of wound healing

## ABNORMAL HEALING

### Hypertrophic Scar

- scar remains roughly within boundaries of original injury
- red, raised, widened, frequently pruritic
- common sites: back, shoulder, sternum
- treatment: pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision if other options fail (however, may still recur), typically improves with time

### Keloid Scar

- scar extends beyond boundaries of original injury
- frequently pruritic, often painful; collagen in whorls rather than bundles
- common sites: sternum, deltoid, earlobe; more common in darker skinned people
- treatment: pressure garments, silicone gel sheeting, corticosteroid injection, radiation therapy ± surgical excision as a last resort

### Chronic Wound

- fails to heal primarily within 4-6 wk
- common chronic wounds include diabetic, pressure and venous stasis ulcers
- treatment: may heal with meticulous wound care; may also require surgical intervention
- Marjolin's ulcer: squamous cell carcinoma arising in a chronic wound secondary to genetic changes caused by chronic inflammation → consider biopsy of chronic wound

## WOUND CLOSURE

### Primary (1°) Closure (First Intention)

- definition: wound closure by direct approximation of edges within hours of wound creation (i.e. with sutures, staples, skin graft, etc.)
- indication: recent (<6 h, longer with facial wounds), clean wounds
- contraindications: animal/human bites (except on face), crush injuries, infection, long time lapse since injury (>6-8 h), retained foreign body

### Secondary (2°) Closure/Spontaneous Healing (Second Intention)

- definition: wound left open to heal spontaneously (epithelialization 1 mm/d from wound margins in concentric pattern), contraction (myofibroblasts) and granulation – maintained in inflammatory phase until wound closed; requires dressing changes; inferior cosmetic result
- indication: when 1° closure not possible or indicated (see *Primary Closure*, above)

### Tertiary (3°) Closure/Delayed Primary Closure (Third Intention)

- definition: intentionally interrupt healing process (e.g. with packing), then wound can be closed at 4-10 d post-injury after granulation tissue has formed and there is <10<sup>5</sup> bacteria/gram of tissue
- indication: contaminated (high bacterial count), long time lapse since initial injury, severe crush component with significant tissue devitalization
- prolongation of inflammatory phase decreases bacterial count and lessens chance of infection after closure

## Contaminated and Infected Wounds

### Definitions

- contamination: the presence of non-replicating microorganisms within a wound
- colonization: the presence of replicating microorganisms within a wound
- infection: greater than 10<sup>5</sup> microorganisms in a wound without intact epithelium, a wound may also be infected with small amounts of a very virulent organism (e.g. GBS)

### Management of Acute Contaminated Wound (<24 h)

- cleanse and irrigate open wound with physiologic solution (NS or RL)
- evaluate for injury to underlying structures (vessels, nerve, tendon and bone)
- control active bleeding
- debridement: removal of foreign material, devitalized tissue, old blood
  - surgical debridement: blade and irrigation if indicated
- systemic antibiotics are commonly indicated for obvious infection, wound older than 8 h, severely contaminated, immunocompromised, involvement of deeper structures (e.g. joints, fractures)
- ± tetanus toxoid 0.5 mL IM ± tetanus immunoglobulin 250 U deep IM (see Table 7 and Table 8)
- ± post-exposure treatment of
  - hepatitis B, HIV, hepatitis C (if titres confirmed at 6 mo)

#### Risk Factors for Infection

- Virulence of the infecting microorganism
- Amount of bacteria present
- Host resistance

- re-evaluate in 24-48 h for signs of deep infection
  - open infected portion of wound by removing sutures if evidence of infection (i.e. erythema, warmth, pain, discharge)

**Table 7. Risks for Tetanus**

Wound Characteristics	Tetanus-Prone	Not Tetanus-Prone
Time since injury	> 6 h	< 6 h
Depth of injury	> 1 cm	< 1 cm
Mechanism of Injury	Crush, burn, gunshot, frostbite, puncture through clothing, farming injury	Sharp cut (e.g. clean knife, clean glass)
Devitalized tissue	Present	Not present
Contamination (e.g. soil, dirt, saliva, grass)	Yes	No
Retained foreign body	Yes	No

**Table 8. Tetanus Immunization Recommendations**

History of Tetanus Immunization	Clean, Minor Wounds		All Other Wounds	
	Td or Tdap*	Tig**	Td or Tdap	Tig
Uncertain or <3 doses of immunization	Yes	No	Yes	Yes
3 doses received in immunization series	No~	No	No§	No¶

\* 0.5 mL of combined tetanus and diphtheria toxoids ± acellular pertussis

\*\* Tetanus immune globulin, 250 U given at a separate site from Td/Tdap

~ Yes, if >10 yr since last booster

§ Yes, if >5 yr since last booster

¶ Yes, if immunocompromised

### Management of Contaminated Wounds (>24 h, including ulcers)

- irrigation and debridement
  - traumatic tattooing can occur if foreign materials left in wound
- systemic antibiotics indicated if there is concern of infection (e.g. redness, swelling, pain, clinically unwell)
- topical antimicrobials: beneficial for minor wounds, but no additional benefit for wounds requiring systemic antibiotics. May aid in healing of chronic wounds
- closure: final closure via secondary intention (most common), delayed wound closure (3° closure), skin graft or flap; successful closure depends on bacterial count of  $\leq 10^5/\text{cm}^3$  prior to closure and frequent dressing changes

### BITES

- see [Emergency Medicine](#), ER46

### Dog and Cat Bites

- pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*
- investigations: same as for human bites; see below
- treatment: Clavulin® (500 mg PO q8h started immediately – amoxicillin + clavulanic acid)
  - consider rabies prophylaxis if animal has symptoms of rabies or unknown animal
    - ♦ ± rabies Ig (20 IU/kg around wound, or IM) and 1 of the 3 types of rabies vaccines (1.0 mL IM in deltoid, repeat on days 3, 7, 14, 28)
  - aggressive irrigation with debridement
  - healing by secondary intention is mainstay of treatment
  - only consider primary closure for bite wounds on the face; otherwise primary closure is contraindicated
  - contact Public Health if animal status unknown

### Human Bites

- pathogens: *Staphylococcus* >  $\alpha$ -hemolytic *Streptococcus* > *Eikenella corrodens* > *Bacteroides*
- mechanism: most commonly over dorsum of MCP from a punch in mouth; “fight-bite”
- serious, as mouth has  $10^9$  microorganisms/mL, which get trapped in joint space when fist unclenches and overlying skin forms an air-tight covering ideal for anaerobic growth – can lead to septic arthritis
- investigations:
  - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
  - culture for aerobic and anaerobic organisms, Gram stain
- treatment:
  - urgent surgical exploration of joint, drainage and debridement of infected tissue
  - wound must be copiously irrigated
  - Clavulin® 500 mg PO q8h, clindamycin 300 mg PO q6h + ciprofloxacin 500 mg PO q12h (if allergic to penicillin) + secondary closure
  - splint

## Dressings

- there is no one dressing for any given type of wound. Dressing selection depends on the wound characteristics
  - as the wound progresses through healing it will require different types of dressings, therefore, routine inspection is recommended
  - principles of dressings:
    - ♦ moist vs. dry wounds (see Table 9)
      - purpose of dressings should be to keep wound appropriately moist (i.e. moistening dry wounds or removing excess exudate/blood from wet wounds)
    - ♦ clean vs. infected wounds
      - clean wounds can be dressed with petroleum based gauze, which is non-adhering to epithelializing tissue; requires secondary dressing
      - infected wounds can be dressed with iodine gauze, silver-containing, or antimicrobial dressings
    - ♦ wide-based vs. cavitary/tunneling wounds
      - cavitary or tunnelling wounds (i.e. through a fascial layer) can be packed with saline-soaked (non-infected), betadine-soaked (infected) ribbon gauze, or other easily retrievable one-piece moisture providing dressing

**Table 9. Recommended Dressings for Wound Type**

Wound Depth	Exudate Level	Dressing Material
<b>Superficial</b>	Lightly exuding	Films (Opsite®), hydrogels (Intrasite®, Nu-gel®, Duoderm®)
	Any exudate level	Contact layers
<b>Superficial to Deep</b>	Light to moderately exuding wounds	Amorphous gels, hydrogels, hydrocolloids (Duoderm®, Tegaderm®), collagen, hypertonic saline gauze (Mesalt®)
	Moderately to heavily exuding wounds	Foams (Mepilex®, Allevyn®), alginates (Sorbsan®, Kaltostat®), hypertonic saline gauze, hydrofibre (Aquacel®)

Table adapted from Grabb & Smith's Plastic Surgery 6th Edition Chapter 3, Table 3.3

## Reconstruction

### SKIN GRAFTS

#### Definition

- skin that is harvested from a donor site and transferred to the recipient site and that does not carry its own blood supply. Survival requires the generation of new blood vessels from the recipient site bed. They are classified according to the depth of dermis they contain: full thickness (entire epidermis + dermis) vs. split-thickness (epidermis + partial dermis)

#### Donor Site Selection

- must consider size, hair pattern, texture, thickness of skin, and colour (facial grafts best if taken from “blush zones” above clavicle e.g. pre/post auricular or neck)
- partial thickness grafts usually taken from inconspicuous areas (e.g. buttocks, lateral thighs, etc.)

#### Partial Thickness Skin Graft Survival

- 3 phases of skin graft “take”
  1. plasmatic imbibition: diffusion of nutrition from recipient site (first 48 h)
  2. inosculation: vessels in graft connect with those in recipient bed (day 2-3)
  3. neovascular ingrowth: graft revascularized (day 3-5)
- requirements for survival
  - bed: well-vascularized (unsuitable: bone, tendon, heavily irradiated, infected wounds, etc.)
  - contact between graft and recipient bed: fully immobile (decreased shearing and hematoma formation)
  - staples, sutures, splinting, and appropriate dressings (pressure) are used to prevent movement of graft and hematoma or seroma formation
  - site: low bacterial count ( $<10^5/\text{cm}^3$ , to prevent infection)

#### Classification of Skin Grafts

1. by species
  - autograft: from same individual
  - allograft (homograft): from same species, different individual
  - xenograft (heterograft): from different species (e.g. porcine)
2. by thickness: see Table 10

#### Reconstruction Ladder (in the order of increasing complexity of treatment)

- Dressings
- Primary closure
- Delayed closure
- Split thickness graft
- Full thickness graft
- Tissue expansion
- Random pattern flap
- Pedicle flap
- Free flap

Table 10. Skin Grafts

	Split Thickness Skin Graft	Full Thickness Skin Graft
<b>Definition</b>	Epidermis and part of dermis	Epidermis and all of dermis
<b>Donor Site</b>	More sites	Limited donor sites (full thickness skin loss, must be closed 1° or with STSG)
<b>Healing of Donor Site</b>	Re-epithelialization via dermal appendages in graft and wound edges	Primary closure
<b>Re-harvesting</b>	~10 d (faster on scalp)	N/A
<b>Graft Take</b>	Easier; shorter nutrient diffusion distance	Lower rate of survival (thicker, slower vascularization)
<b>Contraction</b>	Less 1° contraction, greater 2° contraction (less with thicker graft)	Greater 1° contraction, less 2° contraction
<b>Aesthetic</b>	Poor	Good
<b>Comments</b>	Can be meshed for greater area (see below) Allows for extravasation of blood/serum	May use on face and fingers
<b>Advantage</b>	Takes well in less favourable conditions, can cover a larger area	Resists contraction, texture/pigment more normal
<b>Disadvantage</b>	Contracts significantly, abnormal pigmentation, high susceptibility to trauma	Requires well vascularized bed Must remove fat from graft before application
<b>Uses</b>	Large areas of skin, granulating tissue beds	Face (colour match), site where thick skin or decreased contracture is desired (e.g. finger)

**Graft Contraction**

- Primary: immediate reduction in size upon harvesting
- Secondary: reduction in size once graft placed on wound bed

- mesh graft
  - **advantages**
    - ♦ prevents accumulation of fluids (e.g. hematoma, seroma)
    - ♦ covers a larger area
    - ♦ best for contaminated recipient site
  - **disadvantages**
    - ♦ poor cosmesis (“alligator hide” appearance)
    - ♦ has significant contractures
- common reasons for graft loss: hematoma/seroma, infection, mechanical force (e.g. shearing, pressure)

**OTHER GRAFTS**

Table 11. Various Tissue Grafts

Graft Type	Use	Preferred Donor Site
<b>Bone</b>	Repair rigid defects	Cranial, rib, iliac, fibula
<b>Cartilage</b>	Restore contour of ear and nose	Ear, nasal septum, costal cartilage
<b>Tendon</b>	Repair damaged tendon	Palmaris longus, plantaris
<b>Nerve</b>	Conduit for regeneration across nerve gap	Sural, antebrachial cutaneous, medial brachial cutaneous
<b>Vessel</b>	Bridge vascular gaps	Forearm or foot vessels for small vessels, saphenous vein for larger vessels
<b>Dermis</b>	Contour restoration ( $\pm$ fat for bulk)	Thick skin of buttock or abdomen
<b>Fat</b>	Contour restoration	Abdomen, any area with fat available

**FLAPS**

- **definition:** tissue transferred from one site to another with a known blood supply (random, pedicled or named); not dependent on neovascularization, unlike a graft
- **may consist of:** skin, subcutaneous tissue, fascia, muscle, bone, other tissue (e.g. omentum)
- **classification:** based on blood supply to skin (random, axial) and anatomic location (local, regional, distant)
- **indications for flaps**
  - reconstruction: replaces tissue loss due to trauma or surgery
  - provides skin and temporary soft tissue coverage through which surgery can be carried out later
  - improves blood supply to poorly vascularized bed (e.g. bone)
- **complications:** flap loss due to hematoma, seroma, infection, poor flap design, extrinsic compression (dressing too tight) or vascular failure/thrombosis, fat necrosis (in free flaps)

**Random Pattern Flaps** (see Figure 15)

- blood supply by dermal and subdermal plexus to skin and subdermal tissue with random vascular supply
- limited length:width ratio to ensure adequate blood supply (typically 2:1)
- flap choice is often a combination of available tissue, location of reconstruction site with respect to donor site, and surgeon preference
- **types**
  - **rotation:** cover wounds of various sizes; common use: sacral pressure sores
  - **transposition:** smaller in size compared to rotation flaps and advancement flaps; commonly used on certain areas of the face using adjacent areas of excess skin laxity
  - **Z-plasty:** used to reorient a scar, lengthen the line of a scar or to break up a scar
  - **advancement flaps (V-Y, Y-V)**
    - ♦ single/bipedicle V-Y flaps: wounds with lax surrounding tissue; the pedicle is the deep tissue underlying the flap

**Figure 15. Wound care flaps – random pattern****Axial Pattern Flaps (Arterialized)**

- flap contains a well defined artery and vein
- allows greater length:width ratio (5-6:1)
- **types**
  - **peninsular flap:** skin and vessel intact in pedicle (see Figure 16)
  - **island flap:** vessel intact, pedicle is better defined (see Figure 17)
  - **free flap:** vascular supply anastomosed at recipient site by microsurgical techniques
- can be sub-classified according to tissue content of flap:
  - e.g. musculocutaneous/myocutaneous (e.g. transverse rectus abdominal myocutaneous) vs. fasciocutaneous

**Free Flaps**

- transplanting expendable donor tissue from one part of the body to another by isolating and dividing a dominant artery and veins to a flap and performing a microscopic anastomosis between these and the vessels in the recipient wound
- survival rates >95%
- **types:** muscle and skin (common), bone, jejunum, omentum
  - e.g. radial forearm, scapular, latissimus dorsi

**Table 12. Free Flap Characteristics**

Characteristic	Normal	Arterial Insufficiency	Venous Insufficiency
Colour	Pink	Pale	Purple or blue
Temperature	Warm	Cool	Warm or cool
Arterial Pulse (Doppler)	+	±	±
Turgor	Soft, but with tissue turgor	Decreased	Increased (i.e. tense)

**Figure 16. Peninsular axial pattern flap****Figure 17. Island axial pattern flap**

# Soft Tissue Infections

**Table 13. Classification of Soft Tissue Infections by Depth**

<b>Erysipelas</b>	Superficial with subcutaneous tissue involvement
<b>Cellulitis</b>	Full thickness with subcutaneous tissue involvement
<b>Fasciitis</b>	Fascia
<b>Myositis</b>	Muscle

## Erysipelas

### Definition

- acute skin infection that is more superficial than cellulitis

### Etiology

- typically caused by Group A  $\beta$ -hemolytic *Streptococcus*

### Clinical Features

- intense erythema, induration, and **sharply demarcated borders** (differentiates it from other skin infections)

### Treatment

- penicillin or first generation cephalosporin (e.g. cefazolin or cephalexin)

## Cellulitis

### Definition

- non-suppurative infection of skin and subcutaneous tissues

### Etiology

- skin flora most common organisms: *S. aureus*,  $\beta$ -hemolytic *Streptococcus*
- immunocompromised: Gram-negative rods and fungi

### Clinical Features

- source of infection
  - trauma, recent surgery
  - PVD, diabetes – cracked skin in feet/toes
  - foreign bodies (IV, orthopaedic pins)
- systemic symptoms (fever, chills, malaise)
- pain, tenderness, edema, erythema with poorly defined margins, regional lymphadenopathy
- can lead to ascending lymphangitis (visible red streaking in skin proximal to area of cellulitis)

### Investigations

- CBC, blood cultures
- culture and Gram stain wound/aspirate from wound if open wound
- plain radiographs if suspect foreign body or abscess
  - r/o bone invasion (osteomyelitis)

### Treatment

- antibiotics: first line – cephalexin 500 mg PO q6h or cloxacillin 500 mg PO q6h x 7 d; if complicated (e.g. lymphangitis, DM) consider IV cefazolin 1-2 g q8h
- outline area of erythema to monitor success of treatment
- immobilize and splint (hands)

**Cellulitis vs. Erysipelas**  
Cellulitis: indistinct borders  
Erysipelas: sharp borders

## Necrotizing Fasciitis

### Definition

- rapidly spreading, very painful infection of the deep fascia with necrosis of tissues
- some bacteria create gas that can be felt as crepitus and be seen on x-rays
- infection spreads rapidly along deep fascial plane and is **limb and life threatening**

### Etiology

- Type I: polymicrobial (less aggressive)
- Type II: monomicrobial, usually  $\beta$ -hemolytic *Streptococcus*

**Soft tissue infections:** Suspect necrotizing fasciitis with rapidly spreading erythema and edema. **Must demarcate** erythematous area on admission in order to determine amount of spread/rapidity of spread.

### Clinical Features

- **pain out of proportion to clinical findings and beyond border of erythema**, edema, tenderness,  $\pm$  crepitus (subcutaneous gas from anaerobes)  $\pm$  fever
- infection spreads very rapidly
- patients may look deceptively well at first, but may rapidly become very sick/toxic
- late findings:
  - skin turns dusky blue and black (secondary to thrombosis and necrosis)
  - induration, formation of bullae
  - cutaneous gangrene, subcutaneous emphysema

### Investigations

- a **clinical diagnosis**
- CT scan only if suspect it is not necrotizing fasciitis (looking for abscess, myonecrosis, etc.)
- severely elevated CK: usually means myonecrosis (late sign)
- hemostat easily passed along fascial plane; fascial biopsy to rule out in equivocal situations

### Treatment

- rigorous resuscitation (ABCs)
- urgent surgical debridement: remove all necrotic tissue, copious irrigation
- IV antibiotics: as appropriate for clinical scenario; consider penicillin 4 million IU IV q4h or clindamycin 900 mg IV q6h until final cultures available
- urgent consultation with infectious disease specialist is recommended

## Ulcers

### Lower Limb Ulcers

#### Traumatic Ulcers (Acute)

- failure of lesions to heal, usually due to compromised blood supply and unstable scar
- usually over bony prominence  $\pm$  edema  $\pm$  pigmentation changes  $\pm$  pain
- treatment: debridement of ulcer and compromised tissue, left to heal via secondary intention with dressings, may need reconstruction with local or distant flap in select cases, vascular status of limb must be assessed clinically and via vascular studies (i.e. sonographically)

#### Non-Traumatic Ulcers (Chronic)

Table 14. Venous vs. Arterial vs. Diabetic Ulcers

Characteristic	Venous (70% vascular ulcers)	Arterial	Diabetic
<b>Cause</b>	Valvular incompetence Venous HTN	2° to small and/or large vessel disease (be aware of risk factors)	Peripheral neuropathy: decreased sensation Atherosclerosis: decreased regional blood flow
<b>History</b>	Dependent edema, trauma Rapid onset $\pm$ thrombophlebitis, varicosities	Arteriosclerosis, claudication Usually >45 yr Slow progression	Diabetes mellitus Peripheral neuropathy
<b>Common Distribution</b>	Medial malleolus	Distal locations	Pressure point distribution
<b>Appearance</b>	Yellow exudates Granulation tissue	Pale/white, necrotic base $\pm$ dry eschar covering	Necrotic base
<b>Wound Margins</b>	Irregular	Even ("punched out")	Irregular or "punched out" or deep
<b>Depth</b>	Superficial	Deep	Superficial/deep
<b>Surrounding Skin</b>	Venous stasis discolouration (brown)	Thin shiny dry skin, hairless, cool	Thin dry skin $\pm$ hyperkeratotic border Hypersensitive/ischemic
<b>Pulses</b>	Normal distal pulses	Decreased distal pulses	Decreased pulses likely
<b>Vascular Exam</b>	ABI >0.9 Doppler; abnormal venous system	ABI <0.9 Pallor on elevation, rubor on dependency Delayed venous filling	ABI is inaccurately high Usually associated with arterial disease
<b>Pain</b>	Moderately painful Increased with leg dependency, decreased with elevation No rest pain	Extremely painful Decreased with dependency, increased with leg elevation and exercise (claudication) Rest pain	Painless No claudication or rest pain Associated paresthesia, anesthesia
<b>Treatment</b>	Leg elevation, rest Compression at 30 mmHg (stockings or elastic bandages) Moist wound dressings $\pm$ topical, systemic antibiotics $\pm$ skin grafts	Rest, no elevation, no compression Moist wound dressing $\pm$ topical and/or systemic antibiotics Modify risk factors (smoking, diet, exercise, etc.) Vascular surgical consultation Treat underlying conditions (DM, proximal arterial occlusion, etc.)	Control diabetes Careful wound care Foot care Orthotics Early intervention for infections (topical and/or systemic antibiotics) Vascular surgical consultation

ABI in diabetics can be falsely normal due to incompressible arteries secondary to plaques/calcification.

All chronic ulcers require vascular studies and a vascular consult.

## Pressure Ulcers

### Common Sites

- over bony prominences; 95% on lower body

### Stages of Development

1. hyperemia: disappears 1 h after pressure removed
2. ischemia: follows 2-6 h of pressure
3. necrosis: follows >6 h of pressure
4. ulcer: necrotic area breaks down – N.B. skin is like tip of an iceberg

### Classification (National Pressure Ulcer Advisory Panel 2007)

Stage I: nonblanchable erythema present >1 h after pressure relief, skin intact

Stage II: partial-thickness skin loss

Stage III: full-thickness skin loss into subcutaneous tissue, but not through fascia

Stage IV: through fascia into muscle, bone, tendon, or joint

- if an eschar is present, must fully debride before staging possible

### Prevention

- good nursing care (clean dry skin, frequent repositioning), special beds or mattress (Kin Air®), proper nutrition, activity, early identification of individuals at risk (e.g. immobility, incontinence, paraplegia, etc.)

### Treatment

- depends on individual patient and condition
- treat underlying medical issues including nutrition
- continue with preventative measures (pressure relief)
- wound debridement, moisture retentive or antimicrobial dressing, regular reassessment
- topical antimicrobials at treating physician's discretion, systemic antibiotics for infections
- assess for possible reconstruction

### Complications

- cellulitis, osteomyelitis, sepsis, gangrene

## Burns

## Burn Injuries

### Causal Conditions

- thermal (flame contact, scald)
- chemical
- radiation (UV, medical/therapeutic)
- electrical

### Most Common Etiology

- children: scald burns
- adults: flame burns

**Table 15. Skin Function and Burn Injury**

Skin Function	Consequence of Burn Injury	Intervention Required
Thermoregulation	Prone to lose body heat	Must keep patient covered and warm
Control of fluid loss	Loss of large amounts of water and protein from the skin and other body tissues	Adequate fluid resuscitation is imperative
Mechanical barrier to bacterial invasion and immunological organ	High risk of infection	Antibiotic ointments (systemic if signs of specific infection present) Tetanus prophylaxis if necessary

## Pathophysiology of Burn Wounds

- amount of tissue destruction is based on temperature, time of exposure, and specific heat of the causative agent (see Figure 18)
- **zone of hyperemia:** vasodilation from inflammation; entirely viable, cells recover within 7 d; contributes to systemic consequences seen with major burns
- **zone of stasis (edema):** decreased perfusion; microvascular sludging and thrombosis of vessels results in progressive tissue necrosis → cellular death in 24–48 h without proper treatment
  - factors favoring cell survival: moist, aseptic environment, rich blood supply
  - zone where appropriate early intervention has most profound effect in minimizing injury
- **zone of coagulation (ischemia):** no blood flow to tissue → irreversible cell damage → cellular death/necrosis

Figure 18. Zones of thermal injury

## Diagnosis and Prognosis

- burn size (see Figure 19)
  - % of TBSA burned: rule of 9s for 2° and 3° burns only (children <10 yr old use Lund-Browder chart – see Figure 20)
  - for patchy burns, surface area covered by patient's palm (fingers closed) represents approximately 1% of TBSA
- age: more complications if <3 or >60 yr old
- depth: difficult to assess initially – history of etiologic agent and time of exposure helpful (see Table 16)
- location: face and neck, hands, feet, perineum are critical areas requiring special care of a burn unit (see *Indications for Transfer to Burn Centre*, PL18)
- inhalation injury: can severely compromise respiratory system
- associated injuries (e.g. fractures)
- co-morbid factors (e.g. concurrent disability, alcoholism, seizure disorders, chronic renal failure) can exacerbate extent of injury

Figure 19. Rule of 9s for TBSA

Prognosis best determined by burn size (TBSA), age of patient, presence/absence of inhalation injury.

Circumferential burns can restrict respiratory excursion and/or blood flow to extremities and require escharotomy.

TBSA does not include areas with 1° burns.

Figure 20. Lund-Browder diagram

Table 16. Burn Depth (1st, 2nd, 3rd degree)

Nomenclature	Traditional Nomenclature	Depth	Clinical Features
Erythema/Superficial	First degree	Epidermis	Painful, sensation intact, erythema, blanchable
Superficial-Partial Thickness	Second degree	Into superficial dermis	Painful, sensation intact, erythema, blisters with clear fluid, blanchable, hair follicles present
Deep-Partial Thickness	Second degree	Into deep (reticular) dermis	Insensate, difficult to distinguish from full thickness, does not blanch, some hair follicles still attached, softer than full thickness burn
Full Thickness	Third degree Fourth degree	Through epidermis and dermis Injury to underlying tissue structures (e.g. muscle, bone)	Insensate (nerve endings destroyed), hard leathery eschar that is black, grey, white, or cherry red in colour, hairs do not stay attached, may see thrombosed veins

## Indications for Transfer to Burn Centre

### American Burn Association Criteria

- total 2° and 3° burns >10% TBSA
- burns involving the face, hands, feet, genitalia, perineum, or major joints
- 3° burns in any age group
- electrical burns, including lightning (internal injury underestimated by TBSA)
- chemical burns
- inhalation injury (may lead to respiratory distress)
- burns associated with major trauma/serious illness
- burned children in hospitals without appropriate child burn care
- burns in patients who will require special social, emotional, or rehabilitative intervention.

## Acute Care of Burn Patients

- adhere to ATLS protocol
- resuscitation using Parkland formula to restore plasma volume and cardiac output
  - 4 cc RL/kg/% TBSA over first 24 h (1/2 within first 8 h of sustaining burn, 1/2 in next 16 h)

- extra fluid administration required if
  - burn >80% TBSA
  - 4° burns
  - associated traumatic injury
  - electrical burn
  - inhalation injury
  - delayed start of resuscitation
  - pediatric burns
- monitor resuscitation
  - urine output is best measure: maintain at >0.5 cc/kg/h (adults) and 1.0 cc/kg/h (children <12 yr)
  - maintain a clear sensorium, HR <120/min, MAP >70 mmHg
- burn specific care
  - relieve respiratory distress: intubation and/or escharotomy (see sidebar)
  - prevent and/or treat burn shock: 2 large bore IVs
  - identify and treat immediate life-threatening conditions (e.g. inhalation injury, CO poisoning)
  - determine TBSA affected first, since depth is difficult to determine initially (easier to determine after 24 h)
- tetanus prophylaxis if needed
  - all patients with burns >10% TBSA, or deeper than superficial partial thickness, need 0.5 cc tetanus toxoid
  - also give 250 U of tetanus Ig if prior immunization is absent/unclear, or the last booster >10 yr ago
- baseline laboratory studies (Hb, U/A, BUN, CXR, electrolytes, ECG, cross-match, ABG, carboxyhemoglobin)
- cleanse, debride, and treat the burn injury (antimicrobial dressings)
- early excision and grafting important for outcome

### Respiratory Problems

- 3 major causes
  - burn eschar encircling chest
    - ♦ distress may be apparent immediately
    - ♦ perform escharotomy to relieve constriction
  - CO poisoning
    - ♦ may present immediately or later
    - ♦ treat with 100% O<sub>2</sub> by facemask (decreases half-life of carboxyhemoglobin from 210 to 59 min) until carboxyHb <10%
  - smoke inhalation leading to pulmonary injury
    - ♦ chemical injury to alveolar basement membrane and pulmonary edema (insidious onset)
    - ♦ risk of pulmonary insufficiency (up to 48 h) and pulmonary edema (48-72 h)
    - ♦ watch for secondary bronchopneumonia (3-25 d) leading to progressive pulmonary insufficiency
    - ♦ intubate patient with any signs of inhalation injuries

### Burn Wound Healing

**Table 17. Burn Shock Resuscitation (Parkland Formula)**

<b>Hour 0-24</b>	4 cc RL/kg/% TBSA with 1/2 of total in first 8 h from time of injury and 1/2 of total in next 16 h from time of injury
<b>Hour 24-30</b>	0.35-0.5 cc plasma/kg/%TBSA
<b>&gt;Hour 30</b>	D5W at rate to maintain normal serum sodium

\*Do not forget to add maintenance fluid to resuscitation

**Table 18. Burn Wound Healing**

Depth	Healing
First degree	No scarring. Complete healing
Second degree (Superficial partial)	Spontaneously re-epithelialize in 7 to 14 d from retained epidermal structures ± residual skin discolouration Hypertrophic scarring uncommon. Grafting rarely required
Deep second degree (Deep partial)	Re-epithelialize in 14-35 d from retained epidermal structures Hypertrophic scarring frequent Grafting recommended to expedite healing
Third degree (Full thickness)	Re-epithelialize from the wound edge Grafting/flap necessary to replace dermal integrity, limit hypertrophic scarring
Fourth degree	Often results in amputations If not requiring amputation, needs flap for coverage after debridement (do not reepithelialize – cannot graft)

#### Signs of CO Poisoning

- Headache
- Confusion
- Coma
- Arrhythmias

#### Inhalation Injuries 101

- Indicators of inhalation injury
  - Injury in a closed space
  - Facial burn
  - Singed nasal hair/eyebrows
  - Soot around nares/oral cavity
  - Hoarseness
  - Conjunctivitis
  - Tachypnea
  - Carbon particles in sputum
  - Elevated blood CO levels (i.e. brighter red)
- Suspected inhalation injury requires immediate intubation due to impending airway edema. Failure to diagnose inhalation injury can result in airway swelling and obstruction, which, if untreated, can lead to death.
- Neither CXR or ABG can be used to rule out inhalation injury.
- Direct bronchoscopy now used for diagnosis.

## Treatment

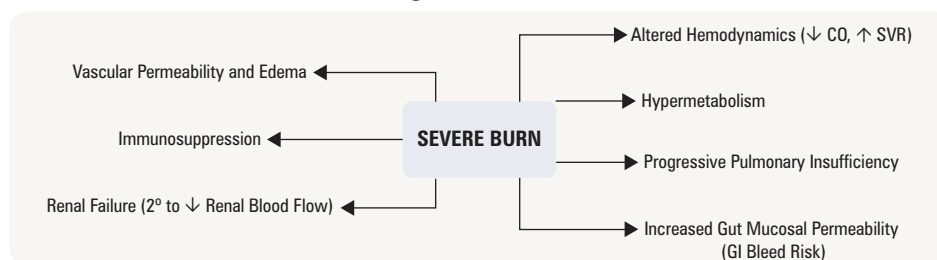

- 3 stages
  - assessment: depth determined
  - management: specific to depth of burn and associated injuries
  - rehabilitation
- first degree
  - treatment aimed at comfort
    - topical creams (pain control, keep skin moist) ± aloe
    - oral NSAIDs (pain control)
- superficial second degree
  - daily dressing changes with topical antibiotics, polysporin, may use a temporary biological or synthetic covering to close the wound; leave blisters intact unless circulation impaired or unless over joint inhibiting motion
- deep second degree and third degree
  - prevent infection and sepsis (significant cause of death in burn patients)
    - most common organisms: *S. aureus*, *P. aeruginosa* and *C. albicans*
      - day 1-3 (rare): Gram-positive
      - day 3-5: Gram-negative (*Proteus*, *Klebsiella*)
    - topical antimicrobials: prevent bacterial infection (from skin flora, gut flora or caregiver) and secondary sepsis (see Table 19)
  - remove dead tissue
    - surgically debride necrotic tissue, excise to viable (bleeding) tissue

**Table 19. Topical Antibiotic Therapy for Burns**

Antibiotic	Pain with Application	Penetration	Adverse Effects
Silver nitrate (0.5% solution)	None	Minimal	May cause methemoglobinemia, stains (black), leaches sodium from wounds
Nanocrystalline silver-coated dressing (Acticoat®)	None or transient	Medium, does not penetrate eschar. Preferred over silver sulfadiazine and silver nitrate	May stain, producing a pseudoeschar or facial discolouration (argyria-like symptoms); raised liver enzymes
Silver sulfadiazine (cream) (Silvadene®)	Minimal	Medium, does not penetrate eschar	Slowed healing, leukopenia, mild inhibition of epithelialization
Mafenide acetate (solution/cream) (Sulfamylon®)	Moderate	Well, penetrates eschar	Mild inhibition of epithelialization, may cause metabolic acidosis with wide application

- early excision and grafting is the mainstay of treatment
- initial dressing should decrease bacterial proliferation
- indication for skin graft: deep 2° or 3° burn that is > size of a quarter
- prevention of wound contractures: pressure dressings, joint splints, early physiotherapy

## Other Considerations in Burn Management

**Figure 21. Systemic effects of severe burns**

- nutrition
  - hypermetabolism: TBSA >40% have BMR 2-2.5x predicted
  - calories, vitamin C, vitamin A,  $\text{Ca}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Fe}^{2+}$
- immunosuppression and sepsis
  - must keep bacterial count <10<sup>5</sup> bacteria/g of tissue (blood culture may not be positive)
  - signs of sepsis: sudden onset of hyper/hypothermia, unexpected CHF or pulmonary edema, development of ARDS, ileus >48 h post-burn, mental status changes, azotemia, thrombocytopenia, hypofibrinogenemia, hyper/hypoglycemia (especially if burn >40% TBSA)
- GI bleed may occur with burns >40% TBSA (usually subclinical)
  - treatment: tube feeding or NPO, antacids, H<sub>2</sub> blockers (preventative)
- renal failure secondary to under resuscitation, drugs, myoglobin, etc.
- progressive pulmonary insufficiency
  - can occur after: smoke inhalation, pneumonia, cardiac decompensation, sepsis
- wound contracture and hypertrophic scarring
  - largely preventable with timely wound closure, splinting, pressure garments and physiotherapy

### Risk Factors for Infection of Burn Wounds

#### Patient Related

- Extent > 30% TBSA
- Depth: full-thickness and deep partial-thickness
- Patient age (higher risk with very young and very old)
- Co-morbidities
- Wound dryness
- Wound temperature
- Secondary impairment of blood flow to wound
- Acidosis

#### Microbial Factors

- Density > 10<sup>5</sup> organisms per gram tissue
- Motility
- Virulence and metabolic products (endotoxin, exotoxin, permeability factors, other factors)
- Antimicrobial resistance

### Meta-Analysis of Early Excision of Burns

Burns 2006;32:145-150

**Purpose:** To determine if early excision and grafting is superior (or equivalent) to conservative treatment and delayed grafting once the burn eschar has separated.

**Methods:** A literature review was completed seeking prospective randomized controlled trials comparing early excision (<7 d) and immediate grafting against treatment with dressings followed by grafting post-eschar separation. All ages and burn severities were included. Outcomes were mortality, blood transfusions, wound healing time and length of hospital stay.

**Results:** A total of 361 patients from 7 randomized controlled trials were included in the meta-analysis. 180 patients received early intervention and 181 received conservative management. There was no significant difference in mortality in patients with inhalational injury. Early excision and grafting in patients without inhalational injury resulted in significantly reduced mortality (RR 0.36,  $p < 0.05$ ) and decreased length of hospitalization by 8.89 d ( $p < 0.05$ ). The number of patients requiring blood transfusion was significantly higher with early excisional management (SMD 1.65,  $p < 0.05$ ). There was no significant difference in wound healing time between the two groups.

**Conclusion:** Early excision of burns (<7 d) is beneficial in reducing mortality in patients without inhalational injury, along with reducing length of time spent in hospital.

## Special Considerations

### CHEMICAL BURNS

- major categories: acid burns, alkaline burns, phosphorous burns, chemical injection injuries
- common agents: cement, hydrofluoric acid, phenol, tar
- mechanism of injury: chemical solutions coagulate tissue protein leading to necrosis
  - acids → coagulation necrosis
  - alkalines → saponification followed by liquefactive necrosis
- severity related to: type of chemical (alkali worse than acid), temperature, volume, concentration, contact time, site affected, mechanism of chemical action, degree of tissue penetration
- burns are deeper than they initially appear and may progress with time

### Treatment (general)

- ABCs, monitoring
- remove contaminated clothing and brush off any dry powders before irrigation
- irrigation with water for 1-2 h under low pressure (contraindicated in heavy metal burns, such as sodium, potassium, magnesium, and lithium; in these cases soak in mineral oil instead)
- inspect eyes, if affected: wash with saline and refer to ophthalmology
- inspect nails, hair and webspaces
- correct metabolic abnormalities and tetanus prophylaxis if necessary
- local wound care 12 h after initial dilution (debridement)
- wound closure same as for thermal burn
- beware of underestimated fluid resuscitation, renal, liver, and pulmonary damage

### ELECTRICAL BURNS

- depth of burn depends on voltage and resistance of the tissue (injury more severe in tissues with high resistance)
- often presents as small punctate burns on skin with extensive deep tissue damage which requires debridement
- electrical burns require ongoing monitoring as latent injuries can occur
- watch for system specific damages and abnormalities:
  - abdominal: intraperitoneal damage
  - bone: fractures and dislocations especially of the spine and shoulder
  - cardiopulmonary: anoxia, ventricular fibrillation, arrhythmias
  - muscle: myoglobinuria indicates significant muscle damage → compartment syndrome
  - neurological: seizures and spinal cord damage
  - ophthalmology: cataract formation (late complication)
  - renal: ATN resulting from toxic levels of myoglobin and hemoglobin
  - vascular: vessel thrombosis → tissue necrosis (increased Cr, K<sup>+</sup> and acidity), decrease in RBC (beware of hemorrhages/delayed vessel rupture)

### Treatment

- ABCs, primary and secondary survey, treat associated injuries
- monitor: hemochromogenuria, compartment syndrome, urine output
- wound management: topical agent with good penetrating ability (silver sulfadiazine or mafenide acetate)
- debride non-viable tissue early and repeat prn (every 48 h) to prevent sepsis
- amputations frequently required

### FROSTBITE

- see [Emergency Medicine](#), ER45

Speed is essential in the management of chemical burns as chemicals can continue to cause damage until they are removed or neutralized.

**Tar:** remove with repeated application of petroleum-based antibiotic ointments (e.g. Polysporin®).

#### Treatment (specific)

**Acid burns:** water irrigation followed by dilute solution of sodium bicarbonate  
**Hydrofluoric acid:** water irrigation; clip fingernails to avoid acid trapping; topical calcium gel ± subcutaneous injection of calcium gluconate ± 10% calcium gluconate IV depending on amount of exposure and pain  
**Sulfuric acid:** treat with soap/lime prior to irrigation, as direct water exposure produces extreme heat

#### Tissue Resistance to Electrical Current:

nerve < vessel/blood < muscle < skin  
 < tendon < fat < bone

# Hand

High pressure injection injury is deceptively benign-looking (small pinpoint hole on finger pad) often with few clinical signs. Intense pain and tenderness, along the course the foreign material traveled, is present a few hours after the injury. Definitive treatment is exposure and removal of foreign material.

**Allen's Test:** while patient's hand is firmly closed, occlude both radial and ulnar arteries. Once fist is open, release either artery and assess collateral flow.

## Approach to Hand Lacerations

**TIN AX**  
Tetanus prophylaxis  
Irrigate with NS  
**NPO**  
Antibiotic prophylaxis  
X-rays

**Figure 22. Testing profundus (FDP) – inserts at distal phalanx**

**Figure 23. Testing superficialis (FDS) – inserts at middle phalanx**

Never blindly clamp a bleeding vessel as nerves are often found in close association with vessels.

Never explore any volar hand wound in the ER!

## Traumatic Hand

**Table 20. Key Features of the History and Physical Exam of the Injured Hand in the Emergency Department**

HISTORY		
<b>Key Questions</b>	Age Hand dominance Occupation Time and place of accident Mechanism of injury Tetanus status	
PHYSICAL EXAM	Structure	Examination
<b>Observation</b>	Position of finger Deformity Bruising or swelling Sweating pattern Anatomical structures beneath	Abnormal cadence (fingers normally slightly flexed), scissoring Bony or specific (e.g. mallet, swan neck) May indicate underlying skeletal injury May indicate denervation If open laceration, need to explore within wound (under sterile conditions)
<b>Vascular Status</b>	Radial and ulnar arteries Digital arteries Temperature and skin turgor	Allen's Test (see sidebar) Capillary refill (<2-3 s) For each test, need to compare both sides
<b>Sensory (refer to Figure 3)</b>	Median nerve Ulnar nerve Radial nerve Digital nerves	Dorsal radial tip of index finger Dorsal ulnar tip of little finger Dorsal web space of the thumb 2 point discrimination of each finger
<b>Motor Function</b>	Median nerve Ulnar nerve Radial nerve	Extrinsic muscles: flex DIP of index finger ("OK sign") Intrinsic muscles: thumb to ceiling with palm up Extrinsic muscles: flex DIP of little finger Intrinsic muscles: abduct index finger ("Peace sign") or patient able to hold piece of paper between adducted fingers and resist pulling Extrinsic muscles: extend thumb ("thumb's up") and wrist
<b>Range of Motion</b>	Tendons, bones, joints, nerves	Assess active and passive range of motion of wrist extension/flexion/ulnar/radial deviation, finger abduction/adduction/flexion/extension, thumb flexion/extension/abduction/adduction/circumflexion
<b>Tendons</b>	Flexor digitorum profundus (FDP) Flexor digitorum superficialis (FDS)	Stabilize PIP joint in extension, ask patient to flex fingers (at DIP) (see Figure 22) Stabilize non-exam fingers in extension (neutralizes FDP) and ask patient to flex examination finger (see Figure 23)
<b>Palpation</b>	Bones Joints	Focal tenderness or abnormal alignment Instability may indicate ligamentous injury or dislocation

## General Management

### Nerves

- direct repair for a clean injury within 14 d and without concurrent major injuries → otherwise secondary repair
- epineurial repair of digital nerves with minimal tension
- post-operative: dress wound, elevate hand and immobilize
- Tinel's sign (cutaneous percussion over the repaired nerve) produces paresthesias and defines level of nerve regeneration
  - Wallerian degeneration occurs in the first 2 wk, which is why there is no Tinel's sign till after this time period
  - a peripheral nerve regenerates at 1 mm/d
  - paresthesias felt at area of percussion because re-growth of myelin (Schwann cells) is slower than axonal re-growth → percussion on exposed free-end of axon generates paresthesia

### Vessels

- often associated with nerve injury (anatomical proximity)
- control bleeding with direct pressure and hand elevation
- if digit devascularized, optimal repair within 6 h
- dress, immobilize, and splint hand with finger tips visible
- monitor colour, capillary refill, skin turgor, fingertip temperature post-revascularization

### Tendons

- most tendon lacerations require primary repair
- many extensors are repaired in the emergency room, flexors are repaired in the operating room within 2 wk
- avoid excessive immobilization (specific protocols for flexors, 2-3 wk for extensors) to minimize stiffness and facilitate rehabilitation

### Bones

- see *Fractures and Dislocations*, PL25

### Nailbed

- remove nail to examine underlying nailbed under digital block anesthesia
- irrigate wound and nail thoroughly
- suture repair of nailbed with catgut suture
- replace cleaned nail, which acts as splint for any underlying distal phalangeal fracture and prevents adhesion formation between nail fold and nailbed

Arterial bleeding from a volar digital laceration may indicate nerve laceration (nerves in digits are superficial to arteries).

#### Compartment Syndrome

Watch out for these signs with a closed or open injury: tense, painful extremity (worse on passive stretch), paresthesia/paralysis, pallor, distal pulselessness (often late in process), and contracture (irreversible ischemia). Intracompartmental pressures can be measured (normal pressure = up to 12 mmHg), but a clinical diagnosis is an indication for an emergent fasciotomy. If untreated, end result is ischemic contracture of the extremity (Volkmann's contracture).

## Hand Infections

### Principles

- trauma is most common cause
- 5 cardinal signs: *rubor* (red), *calor* (hot), *tumour* (swollen), *dolor* (painful) and *functio laesa* (loss of function)
- 90% caused by Gram-positive organisms
- most common organisms (in order) – *S. aureus*, *S. viridans*, Group A *Streptococcus*, *S. epidermidis*, and *Bacteroides melaninogenicus* (MRSA becoming more common)

### TYPES OF INFECTIONS

#### Deep Palmar Space Infections

- uncommon, involve thenar or mid-palm, treated in OR

#### Felon

- **definition:** subcutaneous abscess in the fingertip that commonly occurs following severe paronychia or a puncture wound into the pad of digit; may be associated with osteomyelitis
- **treatment:** elevation, warm soaks, cloxacillin 500 mg PO q6h (if in early stage); if obvious abscess then I&D and PO cloxacillin

#### Flexor Tendon Sheath Infection

- *Staphylococcus* > *Streptococcus* > Gram-negative rods
- **definition:** acute suppurative tenosynovitis commonly caused by a penetrating injury and can lead to tendon necrosis and rupture if not treated
- **clinical features:** Kanavel's 4 cardinal signs:
  1. point tenderness along flexor tendon sheath (earliest and the most important)
  2. severe pain on passive extension of DIP (second most important)
  3. fusiform swelling of entire digit
  4. flexed posture (increased comfort)
- **treatment**
  - OR incision and drainage, irrigation, IV antibiotics, and resting hand splint until infection resolves

#### Herpetic Whitlow

- HSV-1, HSV-2
- **definition:** painful vesicle(s) around fingertip
  - often found in medical/dental personnel and children
- **clinical features:** can be associated with fever, malaise and lymphadenopathy
  - patient is infectious until lesion has completely healed
- **treatment:** routine culture and viral prep protection (cover), consider oral acyclovir; do not break blisters, as this can spread infection

#### Paronychia

- acute = *Staphylococcus*; chronic = *Candida*
- **definition:** infection (granulation tissue) of soft tissue around fingernail (beneath eponychial fold)

- **etiology**
  - acute paronychia: a “hangnail”, artificial nails, and nail biting
  - chronic paronychia: prolonged exposure to moisture
- **treatment**
  - acute paronychia: warm compresses and cephalexin 500 mg PO q6h ± drainage if abscess present
  - chronic paronychia: anti-fungals with possible debridement and marsupialization, removal of nail plate

## Amputations

### Hand or Finger

- emergency management: injured patient and amputated part require attention
  - **patient:** x-rays, NPO, clean wound and irrigate with NS, dress stump with nonadherent, cover with dry sterile dressing, tetanus and antibiotic prophylaxis (cephalosporin/erythromycin)
  - **amputated part:** x-rays, gently irrigate with RL, wrap amputated part in a NS/RL soaked sterile gauze and place inside waterproof plastic bag, place in a container, then place container on ice
- **indications for replantation**
  - **age:** children often better results than adults
  - **level of injury:** proximal, thumb and multiple digit amputations are higher priority
  - **nature of injury:** clean cut injuries have higher successful replantation rate; avulsion and crush injuries are relative contraindications to replant
- if replant contraindicated manage stump with revision amputation
  - would only allow a fingertip injury to heal by secondary intention

## Tendons

### Common Extensor Tendon Deformities

Table 21. Extensor Tendon Deformities

Injury	Definition	Zone	Etiology/Clinical Features	Treatment
<b>Mallet Finger</b>	DIP flexed with loss of active extension (see Figure 25)	1	Forced flexion of the extended DIP joint leading to extensor tendon rupture at DIP joint (e.g. sudden blow to tip of the finger)	Splint DIP in extension for 6 wk followed by 2 wk of night splinting. If inadequate improvement after 6 wk, check splinting routine and recommend 4 more wk of continuous splinting
<b>Boutonniere Deformity</b>	PIP flexed, DIP hyperextended (see Figure 26)	3	Injury or disease affecting the extensor tendon insertion into the dorsal base of the middle phalanx Associated with RA or trauma (laceration, volar dislocation, acute forceful flexion of PIP)	Splint PIP in extension and allow active DIP motion
<b>Swan Neck Deformity</b>	PIP hyperextended, DIP flexed (see Figure 27)	3	Trauma (PIP volar plate injury) Associated with RA and old, untreated mallet deformity	Splint to prevent PIP hyperextension or DIP flexion Consider arthrodesis/arthroplasty

### De Quervain's Tenosynovitis (zone 7; most common cause of radial wrist pain)

- **definition:** inflammation in 1st extensor compartment (APL and EPB)
- **clinical features:**
  - +ve Finkelstein's test (pain over the radial styloid induced by making fist, with thumb in palm, and ulnar deviation of wrist)
  - pain localized to the 1st extensor compartment
  - tenderness and crepitation over radial styloid may be present
  - differentiate from CMC joint arthritis (CMC joint arthritis will have a positive grind test, whereby crepitus and pain are elicited by axial pressure to the thumb)
- **treatment:**
  - mild: NSAIDs, splinting and steroid injection into the tendon sheath (successful in over 60% of cases)
  - severe: surgical release of stenotic tendon sheaths (APL and EPB); remember there may be 2 or more sheaths

### Ganglion Cyst (zone 7)

- **definition:**
  - fluid-filled synovial lining that protrudes between carpal bones or from a tendon sheath; most commonly carpal in origin
  - most common soft tissue tumour of hand and wrist (60% of masses)

Figure 24. Zone of extensor tendon injury (odd numbered zones fall over a joint)

Figure 25. Mallet finger deformity

Figure 26. Boutonniere deformity

Figure 27. Swan neck deformity

- **clinical features:**
  - most common around scapholunate ligament junction
  - 3 times more common in women than in men
  - more common in younger individuals
  - can be large or small – may drain internally so size may wax and wane
  - often non-tender although tenderness increased when cyst smaller (from increased pressure within smaller cyst sac)
- **treatment:**
  - conservative treatment: watch and wait
  - aspiration (recurrence rate 65%)
  - consider operative excision of cyst and stalk (recurrence is possible)
  - steroids if painful

### Common Flexor Tendon Deformities (see Figure 28)

- flexor tendon zones (important for prognosis of tendon lacerations)
- “no-man’s land”:
  - between distal palmar crease and mid-middle phalanx
  - zone where superficialis and profundus lie ensheathed together
  - recovery of glide very difficult after injury

### Stenosing Tenosynovitis (trigger finger/thumb)

- **definition:** inflammation of synovium causes size discrepancy between tendon and sheath/pulley (most commonly at A-1 pulley) = locking of thumb or finger in flexion/extension
- **etiology:** idiopathic or associated with RA, diabetes, hypothyroidism and gout
- **clinical features:**
  - thumb, ring and long fingers most commonly affected
  - patient complains of catching, snapping or locking of affected finger
  - tenderness to palpation/nodule at palmar aspect of MCP over A-1 pulley
  - women are 4 times more likely than men to be affected
- **conservative treatment:**
  - NSAIDs
  - steroid injection
  - surgical flexor tendon release
  - injections less likely to be successful in patients with DM or symptoms greater than 6 mo
- **surgical treatment:**
  - incise A-1 flexor tendon pulley to permit unrestricted, full active finger motion

A-2 and A-4 pulleys are most important for function; prevent bowstringing of tendons.

Figure 28. Zones of the flexor tendons

## Fractures and Dislocations

- for fracture principles, see [Orthopedics](#), OR5

### FRACTURES

- about 90% of hand fractures are stable in flexion (lock/prevent extension)
- **position of function** (like a hand holding a pop can) (see Figure 29):
  - wrist extension 15°
  - MCP flexion 45°
  - IP flexion (slight)
  - thumb abduction/rotation
  - contraindications: post repair of flexor tendons, median/ulnar nerve injury
- **position of safety** (see Figure 30):
  - wrist extension 45° (position most beneficial for hand function if immobilized)
  - MCP flexion 60° (maximal collateral ligament stretch)
  - PIP and DIP in full extension (maximal volar plate origin stretch)
  - thumb abduction and opposition (functional position)
- stiffness secondary to immobilization is the most important complication; Tx = early motion

### Distal Phalanx Fractures

- most commonly fractured bone in the hand
- usual mechanism is crush injury and thus accompanied by soft tissue injury
- subungual hematoma is common and must be decompressed if painful or nail removed
- treatment consists of 3 wk of digital splinting (with IP joint movement preserved)

### Proximal and Middle Phalanx Fractures

- check for: rotation, scissoring (overlap of fingers on making a fist), shortening of digit
- undisplaced or minimally displaced: closed reduction (if extra-articular) buddy tape to neighbouring stable digit, elevate hand, motion in guarded fashion 10-14 d post injury
- displaced, non-reducible, not stable with closed reduction, or rotational or scissoring deformity: percutaneous pins (K-wires) or ORIF, and splint

Figure 29. Position of function

Figure 30. Position of safety

### Metacarpal Fractures

- generally accept varying degrees of deviation before reduction required: up to 10° (D2), 20° (D3), 30° (D4), or 40° (D5)
- Boxer's fracture (extra-articular):** acute angulation of neck of metacarpal of little finger into palm (see Figure 31)
  - mechanism: blow on the distal-dorsal aspect of closed fist
  - loss of prominence of metacarpal head, volar displacement of head
  - check for scissoring of fingers on making a fist
  - up to 30-40° angulation may be acceptable
  - closed reduction should be considered to decrease the angle
  - if stable ulnar gutter splint x 3 wk with PIP and DIP joints free
- Bennett's fracture (intra-articular):** fracture/dislocation of the base of the thumb metacarpal (see Figure 32)
  - unstable fracture
  - abductor pollicis longus pulls MC shaft proximally and radially causing adduction of thumb
  - treat with percutaneous pinning, thumb spica x 6 wk
- Rolando's fracture (intra-articular):** T- or Y-shaped fracture of the base of the thumb metacarpal (see Figure 33)
  - treat with ORIF with K-wire

Figure 31. Boxer's fracture

Figure 32. Bennett's fracture

Figure 33. Rolando's fracture

### DISLOCATIONS

- must be reduced as soon as possible

#### PIP and DIP Dislocations (PIP more common than DIP)

- usually dorsal dislocation (commonly from hyperextension)
- if closed dislocation: closed reduction and splinting (30° flexion for PIP and full extension for DIP) or buddy taping and early mobilization (prolonged immobilization causes stiffness)
- open injuries are treated with wound care, closed or open reduction and antibiotics

#### MCP Dislocations (relatively rare)

- dorsal dislocations much more common than volar dislocations
- dorsal dislocation of proximal phalanx on metacarpal head; most commonly index finger (hyperextension)
- two types of dorsal dislocation:
  - simple (reducible with manipulation): treat with 2 wk of splinting at 30° MCP flexion
  - complex (volar plate blocks reduction): treat with open reduction and A1 pulley release + extension-blocking splint at 30° flexion (2 wk) then 10° flexion (2 wk)

#### Ulnar Collateral Ligament (UCL) Injury

- forced abduction of thumb (e.g. ski pole injury)
- skier's thumb:** acute UCL injury
- gamekeepers thumb:** chronic UCL injury
- evaluation:** radially deviate joint in full extension and at 30° flexion and compare with non-injured hand. UCL rupture is presumed if injured side deviates more than 30° in full extension or more than 15° in flexion
- Stener's lesion:** the UCL has bony attachments to the adductor aponeurosis and the proximal ligament can displace while the distal attachment remains deep to the aponeurosis, forming a barrier that blocks healing and leads to chronic instability; requires surgery

## Dupuytren's Disease

### Definition

- contraction of longitudinal palmar fascia, forming nodules (usually painless), fibrous cords and eventually flexion contractures at the MCP and interphalangeal joints (see Figure 34)
- flexor tendons not involved
- Dupuytren's diathesis: early age of onset, strong family history, and involvement of sites other than palmar aspect of hand

### Epidemiology

- genetic disorder, unusual in patients from African and Asian countries, high incidence in northern Europeans, men > women, often presents in 5th-7th decade of life, associated with but not caused by alcohol use and diabetes

### Clinical Features

- order of digit involvement (most common to least common): ring > little > long > thumb > index
- may also involve feet (Lederhosen's) and penis (Peyronie's – see [Urology](#), U29)

Figure 34. Dupuytren's disease

## Treatment

- stages:
  1. palmar pit or nodule: no surgery
  2. palpable band/cord with no limitation of extension of either MCP or PIP: no surgery
  3. lack of extension at MCP or PIP: surgical fasciectomy indicated
  4. irreversible periarticular joint changes/scarring: surgical treatment possible but poorer prognosis compared to stage 3
- indications for percutaneous release:
  - functional impairment
  - MCP joint contractures  $>30^\circ$
  - any PIP contracture
  - rapidly progressive disease
- may recur, especially in Dupuytren's diathesis

## Carpal Tunnel Syndrome

### Definition

- median nerve compression at the level of the flexor retinaculum as opposed to pronator teres syndrome

### Etiology

- median nerve entrapment at wrist
- primary cause is idiopathic
- secondary causes: space occupying lesions (tumours, hypertrophic synovial tissue, fracture callus, and osteophytes), metabolic and physiological (pregnancy, hypothyroidism, acromegaly, and RA), infections, neuropathies (associated with DM or alcoholism), and familial disorders
- job/hobby related repetitive trauma, especially forced wrist flexion

### Epidemiology

- female:male = 4:1, **most common entrapment neuropathy**

### Clinical Features

- sensory loss in median nerve distribution i.e. radial 3.5 digits (see Figure 3)
- discriminative touch often lost first
- classically, patient awakened at night with numb/painful hand, relieved by shaking/dangling/rubbing
- decreased light touch and 2-point discrimination, especially fingertips
- advanced cases: thenar wasting/weakness
- $\pm$  Tinel's sign (tingling sensation on percussion of nerve)
- $\pm$  Phalen's sign (wrist flexion induces symptoms)

### Investigations

- clinical diagnosis
- NCV and EMG may confirm, but do not exclude, the diagnosis

### Treatment

- avoid repetitive wrist and hand motion, wrist splints when repetitive wrist motion required
- conservative: night time splinting to keep wrist in neutral position
- medical: NSAIDs, local corticosteroids injection, oral corticosteroids
- surgical decompression: transverse carpal ligament incision to decompress median nerve
- indications for surgery: numbness and tingling  $\pm$  sensory loss, weakness  $\pm$  muscle atrophy, unresponsive to conservative measures
- complications of surgery: injury to median motor branch, palmar cutaneous branch or superficial transverse vascular arch, local pain (pillar pain), and scar formation

#### Accuracy of the Clinical Assessment for Carpal Tunnel Syndrome

- Phalen's:
  - Sensitivity: 0.75 Specificity: 0.47
- Tinel's:
  - Sensitivity: 0.60 Specificity: 0.67
- Carpal Tunnel Compression Test:
  - Sensitivity: 0.87 Specificity: 0.90

Hand Surgery Update 1996; p.223

#### Development and Validation of Diagnostic Criteria for Carpal Tunnel Syndrome

J Hand Surg 2006;31:919-924

**Purpose:** To develop a clinical diagnostic criteria for carpal tunnel syndrome that modeled the clinical diagnostic practices of experts.

**Methods:** Out of 57 clinical findings associated with CTS, eight were ranked highly by a panel of expert clinicians. Using 256 case histories, a panel of experts decided whether a case did or did not have a diagnosis of CTS. This diagnosis represented the dependent variable for a logistic regression model, to which the eight clinical findings were applied. The regression model was then validated against the consensus of a second panel on the diagnosis of CTS for the case histories.

**Results/Conclusions:** The correlation between the probability of CTS predicted by the regression model and the panel of clinicians was 0.71. Clinical diagnostic criteria that contributed significantly to the model were

1. Numbness and tingling in median nerve distribution
2. Nocturnal numbness
3. Weakness and/or atrophy of the thenar musculature
4. Tinel's sign
5. Phalen's test
6. Loss of 2-point discrimination

#### Radiographic Evolution of the Rheumatoid Hand

**Earliest sign:** erosion of the ulnar styloid.

**Progression:** characterized by symmetrical joint space narrowing and erosions of the carpal bones, MCP and PIP (with DIP relatively spared).

**Late stage:** Swan neck and Boutonniere deformities.

## Rheumatoid Hand

### General Principles

- non-surgical treatments form the foundation in the management of the rheumatoid hand
- surgery only for patients whose goals (improved cosmesis or function) may be achieved

### Surgical Treatment of Common Problems

- synovitis: requires tendon repair if ruptured; can lead to carpal tunnel syndrome and trigger finger
- ulnar drift: MCP arthroplasty, resection of distal ulna, soft tissue reconstruction around wrist
- thumb deformities: can be successfully treated by arthrodesis (surgical fixation of joint to promote bone fusion)

## Brachial Plexus

### Etiology

- common causes of brachial plexus injury: complication of childbirth and trauma
- other causes of injury: compression from tumours, ectopic ribs

### Common Palsies

**Table 22. Named Neonatal Palsies of the Brachial Plexus**

Palsy	Location of Injury	Mechanism of Injury	Features
<b>Duchenne-Erb Palsy</b>	Upper brachial plexus (C5-C6)	Head/shoulder distraction (e.g. motorcycle)	Waiter's tip deformity (shoulder internal rotation, elbow extension, wrist flexion)
<b>Klumpke's Palsy</b>	Lower brachial plexus (C7-T1)	Traction on abducted arm	May include Horner's syndrome ("claw hand")

### Differential Diagnosis

- trauma (blunt, penetrating)
- thoracic outlet syndrome
  - neurogenic: associated with cervical rib; compression of C8/T1
  - vascular: pain or sensory symptoms without cervical rib; cessation of radial pulse with provocative maneuvers
- tumour
  - schwannoma: well-defined margins makes it easier for total resection
  - neurofibromas: associated with neurofibromatosis type I
  - other: e.g. Pancoast syndrome (apical lung tumour)
- neuropathy (compressive, post-irradiation, viral, diabetic, idiopathic)

### Investigations

- EMG
- MRI: gold standard for identifying soft tissue masses
- CT myelogram: better than MRI for identification of nerve root avulsion and identification of pseudomeningocele. Important for preoperative identification of patients likely to require neurotisation procedures (especially for patients with blunt trauma)

### Management

**Table 23. Management of Brachial Plexus Injuries**

	Type	Treatment
<b>Non-Penetrating Trauma</b>	Concussive/compressive	Usually improves (unless expanding mass, e.g. hematoma)
	Traction/stretch	If no continued insult, follow for 3-4 mo for improvement
	Obstetric palsy	Surgery if no significant improvement and/or residual paresis at 6 mo of age
<b>Penetrating Trauma</b>	Sharp or vascular injury	Explore immediately in OR

## Craniofacial Injuries

- low velocity vs. high velocity injuries determine degree of damage
- fractures cause bruising, swelling and tenderness → loss of function
- frequency: nasal > zygomatic > mandibular > maxillary
- management: can wait 5-10 d for swelling to decrease before ORIF required

## Approach to Facial Injuries

- ATLS protocol
- inspect, palpate, clinical assessment for injury to underlying structures (e.g. facial nerve)
- visual assessment
- tetanus prophylaxis
- radiological evaluation
- wound irrigation with NS/RL and remove foreign materials
- conservative debridement of detached or nonviable tissue
- repair when patient's general condition allows (soft tissue injury: <8 h preferable)

### Investigations (see Table 24)

- CT:
  - axial and coronal (specifically request 1.5 mm cuts): for fractures of upper and middle face (not good for mandible)
  - indicated for high velocity trauma, complex facial fractures, orbital floor, panface fractures, pre-op assessment
- panorex radiograph: shows entire upper and lower jaw; best for isolated mandible fracture as patient must be able to sit

**Table 24. Imaging of the Craniofacial Skeleton**

Structure	Appropriate Imaging
<b>Mandible</b>	Panoramic (panorex)* CT
<b>Zygomatic and orbital bones</b>	CT scan* Water's view (occipitomeatal, A-P "from below"), Town's, AP
<b>Nasal bones</b>	No x-ray required – clinical
<b>Maxilla</b>	CT scan – axial and coronal*

\*Best imaging method

### Treatment

- consultation when indicated (dentistry, ophthalmology)
- re-establish normal occlusion
- pursue normal eye function
- restore stability of face and appearance

### Complications

- diplopia/enophthalmos/blindness
- intracranial pathology such as CSF leak, bleeding and SIADH
- sinusitis
- functional abnormalities (i.e. malocclusion)
- infection – extremely rare
- poor cosmesis; need for 2° surgery

Patients with major facial injuries are at risk of developing upper airway obstruction (displaced blood clots, teeth or fracture fragments; swelling of pharynx and larynx; loss of support of hyomandibular complex → retroposition of tongue). Also at risk of ocular injury.

Suspect C-spine injury with any facial trauma. C-spine evaluation before radiographs are ordered.

Consider intracranial trauma; rule out skull fracture.

#### Signs of Basal Skull Fracture

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF otorrhea

Facial bone injuries with orbit involved require ophthalmology consult.

## Mandibular Fractures

- always two points of injury since it is a ring structure (includes fractures and dislocations)
- commonly at sites of weakness (condylar neck, angle of mandible, region of 3rd molar or canine tooth)

### Etiology

- anterior force: bilateral fractures
- lateral force: ipsilateral subcondylar and contralateral angle or body fracture
- note: classified as open if fracture into tooth bearing area (alveolus)

### Clinical Features

- pain, swelling, difficulty opening mouth ("trismus")
- malocclusion, asymmetry of dental arch
- damaged, loose, or lost teeth
- palpable "step" along mandible
- numbness in V3 distribution
- intra-oral lacerations or hematoma (sublingual)
- chin deviating toward side of a fractured condyle

## Classification

**Table 25. Mandibular Fracture Classifications by Anatomic Region (refer to Figure 35)**

	Areas/Boundaries
<b>Symphysis</b>	Midline of the mandible; between the central incisors from the alveolar process through the inferior border of the mandible
<b>Body*</b>	From the symphysis to the distal alveolar border of the third molar
<b>Angle</b>	Triangular region between the anterior border of the masseter and the posterosuperior insertion of the masseter distal to the third molar
<b>Ramus</b>	Part of the mandible that extends posteriosuperiorly into the condylar and coronoid processes
<b>Condylar</b>	Area of condylar process of mandible
<b>Subcondylar</b>	Area below the condylar neck (i.e. sigmoid notch) of the mandible
<b>Coronoid Process</b>	Area of the coronoid process of mandible

\*Most common mandibular fracture type

## Treatment

- maxillary and mandibular arch bars wired together (intramaxillary fixation) or ORIF
- antibiotics to cover against *S. aureus* and anaerobes

## Complications

- malocclusion, malunion
- tooth loss, and possible sensation loss
- TMJ ankylosis

**Figure 35. Mandibular fracture**

## Maxillary Fractures

**Table 26. Le Fort Classification (refer to Figure 36)**

	Le Fort I	Le Fort II	Le Fort III
<b>Alternative Name</b>	Guerin fracture	Pyramidal fracture	Craniofacial dysjunction
<b>Type of Fracture</b>	Horizontal	Pyramidal	Transverse
<b>Structures Involved</b>	Piriform aperture Maxillary sinus Pterygoid plates	Nasal bones Medial orbital wall Maxilla Pterygoid plates	Nasofrontal suture Zygomaticofrontal suture Zygomatic arch Pterygoid plates
<b>Anatomical Result</b>	Maxilla divided into 2 segments	Maxillary teeth separated from face	Detach entire midfacial skeleton from cranial base

## Nasal Fractures

### Etiology

- lateral force → more common, good prognosis
- anterior force → can produce more serious injuries
- most common facial fracture

### Clinical Features

- epistaxis/hemorrhage, deviation/flattening of nose, swelling, periorbital ecchymosis, tenderness over nasal dorsum, crepitus, septal hematoma, respiratory obstruction, subconjunctival hemorrhage
- depression and splaying of nasal bones causing a saddle deformity
- important to clinically assess for naso-orbital ethmoid (NOE) fractures

### Treatment

- in the absence of complications, no treatment required
- closed reduction with Asch or Walsham forceps under anesthesia, pack nostrils with Adaptic®, nasal splint for 7 d
- best reduction immediately (<6 h) or when swelling subsides (5-7 d)
- rhinoplasty may be necessary later for residual deformity (30%)

**Figure 36. Le Fort fractures**

Always drain septal hematomas as this is a cause of septal necrosis with perforation (saddle nose deformity).

## Naso-orbital Ethmoid Fractures

### Etiology

- fractures of the nasal and ethmoid bones of the medial orbit
- problematic and may lead to greatest change in facial appearance
- Markowitz-Manson classification:
  - Type 1: Single, central fragment, medial canthal ligament intact
  - Type 2: Comminuted central fragment, medial canthal ligament intact
  - Type 3: Severe comminution of central fragment and disrupted medial canthal ligament

### Clinical Presentation

- telecanthus (increased intercanthal distance secondary to medial canthal ligament disruption)
- orbital rim step-off
- similar to nasal fractures (see *Nasal Fractures*, PL30)

### Treatment

- surgical repair to restore intercanthal distance, nasal projection and orbital anatomy

## Zygomatic Fractures

- 3 categories (see Figure 37)
  - fracture restricted to zygomatic arch
  - depressed fracture of zygomatic complex (zygoma)
  - unstable fracture of zygomatic complex (tetrapod fracture) – separations occur at maxilla, frontal bone, temporal bone and orbital rim

### Clinical Features

- flattening of malar prominence (view from above)
- pain over fractures on palpation
- numbness in V2 distribution (infraorbital and superior dental nerves)
- palpable step deformity in bony orbital rim (especially inferiorly)
- often associated with fractures of the orbital floor
- ipsilateral epistaxis; trismus (lock jaw)

### Treatment

- if undisplaced, stable and no symptoms, then soft diet; no treatment necessary
- ophthalmologic evaluation if suspected orbital injury
- uncomplicated zygomatic arch fractures can be elevated using Gillies approach: leverage on the anterior part of the zygomatic arch via a temporal incision; stabilization often unnecessary
- ORIF for displaced or unstable fractures of zygomatic complex

Figure 37. Zygomatic fractures

## Orbital Floor Fractures

- see [Ophthalmology](#), OP42

### Definition

- fracture of floor of orbit ± intact infraorbital rim (see Figure 38)
- may be associated with nasoethmoid fracture

### Etiology

- blunt force to eyeball → sudden increase in intra-orbital pressure (e.g. baseball or fist)

### Clinical Features

- check visual fields and acuity for injury to globe**
- periorbital edema and bruising, subconjunctival hemorrhage
- ptosis, exophthalmos, exorbitism, or enophthalmos
- orbital rim step-offs with possible infraorbital nerve anesthesia
- vertical dystopia (abnormal displacement of the entire orbital cone in the vertical plane); diplopia looking up or down (entrapment of inferior rectus), limited EOM
- orbital entrapment:
  - clinical diagnosis that is a surgical emergency
  - diplopia with vertical gaze; limited EOM
  - severe pain or nausea and vomiting with eye movement
  - requires urgent ophthalmology evaluation and surgical repair

Figure 38. Blow-out fracture

### Investigations

- CT (diagnostic): axial and coronal views
- diagnostic manoeuvre for entrapment is **forced duction** test (pulling on inferior rectus muscle with forceps to ensure full ROM) under anesthesia

### Treatment

- surgical repair indicated if: urgent repair for entrapment, floor defect >1 cm, any size defect with enophthalmos or persistent diplopia (>10 d)
- reconstruction of orbital floor with bone graft or alloplastic material
- ophthalmologic evaluation suggested

### Complications

- persistent diplopia
- enophthalmos

### Superior Orbital Fissure Syndrome

- fracture of SOF causing ptosis, proptosis, anesthesia in V1 distribution, and painful ophthalmoplegia (paralysis of CN III, IV, VI)
- uncommon complication seen in Le Fort II and III fractures (1/130)
- recovery time reported as 4.8–23 wk following operative reduction of fractures

### Orbital Apex Syndrome

- fracture through optic canal with involvement of CN II at apex of orbit
- symptoms are the same as SOF syndrome plus vision loss
- treatment is urgent decompression of fracture in optic canal or steroids (emergency)

Diplopia can present late in orbital blow-out fractures.

## Breast Surgery

### Breast Reconstruction

- integral part of breast cancer treatment
- two basic methods: implants (1-stage or 2-stage) or autologous tissue (see Table 27)
- may also require breast balancing procedure and nipple areola reconstruction

### Pre-Reconstruction Considerations

- radiation: treatment before and after mastectomy is a relative contraindication to alloplastic reconstruction
- recipient tissue: skin sparing mastectomy allows for the use of implants without tissue expanders (1-stage process)
- donor tissue: limited availability of suitable donor tissue (lack of tissue, scar, previous surgery that interferes with blood supply) may prevent the use of autologous tissue reconstruction
- timing (immediate vs. delayed)
- contralateral breast: may not be possible to reconstruct a breast of the same size or shape as the contralateral breast. Breast reduction or mastopexy may be considered in opposite breast (see Table 28)
- other considerations: patient's age and co-morbidities, prognosis, body weight, characteristics of chest wall and patient's attitude

Patients may require a balancing procedure on contralateral side.

**Table 27. Options for Breast Reconstruction**

Procedure	Definition	Surgical Details	Other Comments
<b>Implant</b>	Use of synthetic material (silicone or saline implants)	<i>With expanders</i> (2 stages): Use tissue expanders before replacement with implants to help facilitate breast ptosis. (see <i>Breast Tissue Expanders</i> , PL33) <i>Without expanders</i> (1 stage): In skin-sparing mastectomy, enough skin is available for immediate placement of implant	Complications: capsular contraction (foreign body reaction to implants), rupture or leakage of implant, increased risk of infection, 35% revision rate over 5 yr
<b>Autologous Tissue</b>	Use of patient's own tissue	Many flap options: DIEP, TRAM, latissimus dorsi, SIEA, SGAP, and IGAP	Offers reduced long-term morbidity and natural consistency
<b>Nipple Areola Reconstruction</b>	Final stage of breast reconstruction	Usually require tattooing for areola reconstruction Local vs. distant flap/graft: 1. Local: fish tail or skate flap most common; these flaps allow simultaneous nipple and areola reconstruction 2. Distant: opposite nipple, earlobe, abdominal skin, costal cartilage, labia	Usually performed 3 mo post-reconstruction

## Breast Tissue Expanders

- types: textured vs. smooth, both with integrated port
- placement: sub-pectoral, total submuscular (pectoral/serratus)
- size: depends on contralateral breast and desired size
  - generally over-expanded to facilitate ptosis
- timing of expansion: begins when wound fully healed (usually 2 wk post-op), and implants are expanded weekly or bi-weekly until complete (up to 3 mo). Expanders are exchanged for implants after another 3 mo for consolidation of expanded skin

## Breast Reduction

- reduction mammoplasty performed for relief of physical symptoms (e.g. shoulder groove, neck pain, back pain, shoulder pain, mastodynia), and to improve breast size and shape
- key steps of procedure:
  - incisions: circular around the areola, vertical from areola incision to infra-mammary fold, along the natural infra-mammary fold
  - removal of fat, breast tissue, and excess skin
  - possible need to move nipple and areola complex to higher position
- complications: infection, hemorrhage, decreased nipple sensation, inability to breast feed, breast/nipple asymmetry, nipple loss (partial or complete), skin loss/necrosis, fat necrosis

## Aesthetic Surgery

### Aesthetic Procedures

Table 28. Aesthetic Procedures

Location	Procedure	Description
Head/Neck	Hair transplants	Aesthetic improvement of hair growth patterns using grafts or flaps
	Otoplasty	Surgical correction of protruding ears
	Brow lift	Surgical procedure to lift low brows
Face	Rhytidectomy	Surgical procedure to reduce wrinkling and sagging of the face and neck. "Face lift"
	Blepharoplasty	Surgical procedure to shape or modify the appearance of eyelids by removing excess eyelid skin $\pm$ fat pads
	Rhinoplasty	Intranasal surgical reconstruction of the nose
	Genioplasty	Chin augmentation via osteotomy or synthetic implant to improve contour
	Lip augmentation	Procedure to create fuller lips and to reduce wrinkles around the mouth using collagen injections, fat transferred from other body parts, or implantable materials
Skin	Chemical peel	Application of one or more exfoliating agents to the skin resulting in destruction of portions of the epidermis and/or dermis with subsequent tissue regeneration
	Dermabrasion	Skin re-surfacing by sanding with a rapidly rotating abrasive tool. Often used to reduce scars, irregular skin surfaces and fine lines
	Laser resurfacing	Application of laser to the skin which ultimately results in collagen reconfiguration and subsequent skin shrinking and tightening. Often used to reduce scars and wrinkles
	Injectable fillers	An injectable substance is used to decrease frown lines, wrinkles and nasolabial folds. Substances include collagen, fat, hyaluronic acid and calcium hydroxyapatite
Other	Abdominoplasty	Removal of excess skin and repair of rectus muscle laxity (rectus diastasis). "Tummy tuck"
	Breast augmentation	Surgical breast enhancement with silicone or saline implants (see Figure 39)
	Calf augmentation	Augmentation of calf muscle with implants
	Liposuction	Surgical removal of adipose tissue for body contouring (not a weight loss procedure)
	Mastopexy	Surgical breast lift to elevate breast mound and tighten the skin envelope in ptotic breasts
	Breast reduction	Surgical breast reduction for relief of physical symptoms
	Sclerotherapy	Injection with a sclerosant to treat telangiectasias and varicose veins

Figure 39. Augmentation mammoplasty: incision lines and implant placement

# Pediatric Plastic Surgery

## Craniofacial Anomalies

Table 29. Pediatric Craniofacial Anomalies

	Definition	Epidemiology	Clinical Features	Treatment
<b>Cleft Lip</b>	Failure of fusion of maxillary and medial nasal processes  M:F = 2:1	1 in 1000 live births (1 in 800 Caucasians, increased in Asians, decreased in Blacks) More common on the left (cleft of left lip/palate in boys has hereditary component)	Classified as incomplete/complete and uni/bilateral 2/3 cases: unilateral, left sided, male	Surgery (3 mo): Millard or Tennison-Randall; corrections usually required later on (esp. for nasal deformity)
<b>Cleft Palate</b>	Failure of fusion of lateral palatine/median palatine processes and nasal septum	Isolated cleft palate: 0.5 per 1000 (no racial variation) F > M	Classified as incomplete/complete and uni/bilateral Isolated (common in females) or in conjunction with cleft lip (common in males)	Special bottles for feeding Speech pathologist Surgery (6-9 mo): Von Langenbeck or Furlow Z-Plasty ENT consult – often recurrent OM, requiring myringotomy tubes
<b>Craniosynostosis</b>	Premature fusion of $\geq 1$ cranial sutures Primary – abnormal suture, no known cause This may limit brain growth perpendicular to the suture and cause compensatory growth parallel to the fused suture	1 in 2000 live newborns; M:F = 52:48 Syndromes include: Crouzon's, Apert's, Saethre-Chotzen, Carpenter's, Pfeiffer's Jackson-Weiss and Boston-type syndromes	Syndromic – assoc. with genetic mutation Secondary (to microcephaly, hyperthyroid, rickets, etc.) Dx: irregular head shape, craniofacial abnormalities, x-ray	Multidisc. team (incl. neurosurg, ENT, genetics, dentistry, peds, SLP) Early surgery prevents secondary deformities $\uparrow$ ICP is an indication for emergent surgery ICU bed may be req'd post-surgically

Figure 40. Types of cleft lips and palates

## Congenital Hand Anomalies

Table 30. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies

Classification	Example	Features	Treatment
<b>Failure of formation</b>	Transverse absence (congenital amputation)	At any level (often below elbow/wrist)	Early prosthesis
	Longitudinal absence (phocomelia)	Absent humerus Thalidomide-assoc.	
	Radial deficiency (radial club hand)	Radial deviation Thumb hypoplasia M > F	Physiotherapy + splinting Soft tissue release if splinting fails Distraction osteogenesis (Ilizarov) $\pm$ wedge osteotomy Tendon transfer Pollicization
	Thumb hypoplasia	Degree ranges from small thumb with all components to complete absence	Depends on degree – may involve no treatment, webspace deepening, tendon transfer, or pollicization of index finger
	Ulnar club hand	Rare, compared to radial club hand Stable wrist	Splinting and soft-tissue stretching therapies Soft-tissue release (if above fails) Correction of angulation (Ilizarov distraction)
	Cleft hand	Autosomal dominant Often functionally normal (depending on degree)	First web space syndactyly release Osteotomy/tendon transfer of thumb (if hypoplastic)

**Table 30. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies (continued)**

Classification	Example	Features	Treatment
<b>Failure of differentiation/separation</b>	Syndactyly	Fusion of $\geq 2$ digits 1/3000 live births M:F = 2:1 Classified as partial/complete Simple (skin only) vs. complex (osseous or cartilaginous bridges)	Surgical separation before 6-12 mo of age Usually good result
	Symbrachydactyly	Short fingers with short nails at fingertips	Digital separation (more difficult) Webspace deepening
	Camptodactyly	Congenital flexion contracture (usually at PIP, esp. 5th digit)	Early splinting Volar release Arthroplasty (rarely)
	Clinodactyly	Radial or ulnar deviation Often middle phalanx	None (usually). If severe, osteotomy with grafting
<b>Duplication</b>	Polydactyly	Congenital duplication of digits May be radial (increased in Aborigines and Asians) or central or ulnar (increased in Blacks)	Amputation of least functional digit Usually >1 yr of age (when functional status can be assessed)
<b>Overgrowth</b>	Macroductyly	Rare	None (if mild) Soft tissue/bony reduction
<b>Undergrowth</b>	Brachydactyly	Short phalanges	Removal of non-functional stumps Osteotomies/tendon transfers Distraction osteogenesis Phalangeal/free toe transfer
	Symbrachydactyly (brachysyndactyly)	Short webbed fingers	As above + syndactyly release
<b>Constriction band syndrome</b>	aka amniotic (annular) band syndrome	Variety of presentations	Urgent release for acute, progressive edema distal to band in newborn Other reconstruction is case-specific
<b>Generalized skeletal abnormality</b>	Achondroplasia, Marfan's, Madelung's	Variety of presentations	Treatment depends on etiology

# Historical Context of Public Health

See [Ethical, Legal and Organizational Aspects of Medicine](#), ELOAM17 for *Canada Health Act*

## Definitions

- **population health**
  - health of the population as measured by health status indicators (e.g. life expectancy, low birth weight rates)
  - influenced by: physical, biological, social, environmental, and economic factors; personal health behaviours; health care services
  - refers to the prevailing or desired level of health in the population of a specific country/region/subset of population
  - considered to be more complex than the aggregate health status of individuals within a population
- **public health**
  - systematic organized efforts to protect, promote, and restore the health of the public
  - refers to the practices, procedures, institutions, and disciplines required to achieve the desired state of population health
- **public health and preventive medicine** (formerly called community medicine)
  - the postgraduate study of health and disease in the population or a specified community
  - five-year Royal College specialty training
  - goal: to identify and address health problems and evaluate the extent to which health services and others address these issues (<http://rcpsc.medical.org/information/index.php?specialty=110&submit=Select>)

Source: Last JM. *A Dictionary of Epidemiology*. 4th ed. New York: Oxford University Press, 2001

## Public Health Services in Canada

**Mission:** to promote and protect the health of Canadians, and reduce health inequities through leadership, partnership, innovation, and action in public health

- local public health units and services within regional health authorities (in most provinces except Ontario, where local public health units are either autonomous or within local government) provide programs and activities for health protection, promotion, and disease prevention at local and regional levels
- catchment-area populations range from hundreds to thousands of people, covering areas of 15 to 1.5 million km<sup>2</sup>

## Legislation and Public Health in Canada

**Table 1. Legislation and Public Health in Canada**

Federal	Provincial	Municipal (Ontario)
<ul style="list-style-type: none"> <li>• Health Canada               <ul style="list-style-type: none"> <li>▪ Provides health services to First Nations, Aboriginal peoples, the Canadian military, and veterans</li> <li>▪ Approves new drugs and medical devices</li> </ul> </li> <li>• Canadian Food Inspection Agency               <ul style="list-style-type: none"> <li>▪ Monitors food products</li> <li>▪ Deals with animal-related infections</li> <li>▪ Regulates food labeling</li> </ul> </li> <li>• Public Health Agency of Canada (main Government of Canada agency responsible for public health)               <ul style="list-style-type: none"> <li>▪ An independent body created to strengthen public health capacity</li> <li>▪ Focuses on preventing chronic diseases, preventing injuries, and responding to public health emergencies and infectious disease outbreaks</li> <li>▪ Oversees immigration screening, protects Canadian borders (e.g. airport health inspection)</li> <li>▪ Liases with the World Health Organization (WHO) on global health issues</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Legislation is in the form of Acts and Regulations</li> <li>• Each province has its own Public Health Act or equivalent (e.g. the Health Protection and Promotion Act in Ontario)</li> <li>• Designates the creation of geographic areas for the provision of public health services</li> <li>• Gives powers to the Chief Medical Officer of Health to control public health hazards</li> <li>• Specifies infectious diseases to be reported to public health units by physicians, laboratories, and hospitals (see <i>Appendix</i>, PH25)</li> <li>• Has the ability to mandate programs that address public health issues, environmental health, and chronic disease prevention</li> </ul>	<ul style="list-style-type: none"> <li>• Local boards of health deliver programs mandated by provincial legislation</li> <li>• Boards of health are responsible for the delivery of most public health services, such as:               <ul style="list-style-type: none"> <li>▪ Infectious disease control, including the follow-up of reported diseases and management of outbreaks</li> <li>▪ Inspection of food premises including those in hospitals, nursing homes, and restaurants</li> <li>▪ Family health services including pre-conception, preschool, school-aged, and adult health programs</li> </ul> </li> <li>• Tobacco control legislation enforcement</li> <li>• Assessment and management of local environmental health risks</li> <li>• Collection and dissemination of local health status reports</li> <li>• Public dental health services to children</li> <li>• By-laws may be approved by municipal governments to facilitate public health issues</li> </ul>

The AFMC Primer on Population Health is the core text for the MCC and is available as an online resource on the AFMC website.  
Source: <http://phprimer.afmc.ca>

For the LMCC exam, it is recommended that you also read all of Chapter 15 in Shah CP. *Public health and preventive medicine in Canada*, 5th ed. Toronto: Elsevier, 2003.

Topics covered include:

- Primary, secondary, tertiary and quaternary health care
- Physician remuneration, organization of primary care, new model of primary health care
- Services of other health care professionals: nurses, dentists, chiropractors, podiatrists, optometrists, midwives, pharmacists, and alternative health care providers
- Hospitals and acute care facilities
- Local public health units/ departments: communicable disease control, women's health and maternal and child health, health promotion, dental health, environmental health, population health assessment and health surveillance
- Home care
- Palliative care
- Services for mental illnesses
- Services for cancer patients
- Services for persons with special needs
- Voluntary agencies
- Self-help groups
- Telehealth

### Historical Perspective

Over the last century, Public Health has evolved through three main epidemiological phases:

- **Infectious diseases:** controlled in the more developed world but an issue in less developed countries (e.g. polio, malaria)
- **Chronic diseases:** chronic diseases and other noncommunicable conditions have increased morbidity and mortality (e.g. heart disease and cancer due to risk factors and/or exposures)
- **Re-emerging infectious diseases:** new or re-emergent infections emerge due to unfamiliar or new pathogens, inefficient or inappropriate antibiotic use, travel, and global warming (e.g. HIV, drug resistant TB and malaria)

### Five Core Functions for All Public Health Units

- Population health assessment
- Health, injury, and disease surveillance
- Health promotion
- Disease and injury prevention
- Health protection

# Determinants of Health

## Medical Officer of Health (MOH) (Ontario)

- May be called "Medical Health Officer" (MHO) in other provinces
- Appointed to each public health unit by the board of health
- Held by a licensed physician with public health training
- Responsibilities include:
  - Collection and analysis of epidemiological data
  - Occupational and environmental health surveillance
  - Implementation of health programs, including:
    - counseling
    - family planning services
    - parenting programs, prenatal courses
    - preschool and school health services
    - disease screening programs
    - tobacco use prevention programs
    - nutrition services to schools and seniors' centres
- The Medical Officer of Health can require an individual/premise/agency to take or refrain from any action due to a public health hazard

## Chief Public Health Officer of Canada

- Responsible for the Public Health Agency of Canada and reports to the Minister of Health
  - As the federal government's lead public health professional, provides advice to the Minister of Health and Government of Canada on health issues
  - Collaborates with other governments, jurisdictions, agencies, organizations, and countries on health matters
  - Communicates public health information to health professionals, stakeholders, and the public
  - In an emergency, such as an outbreak or natural disaster, provides direction to Public Health Agency staff, including medical professionals, scientists, and epidemiologists, as they plan and respond to the emergency
- Source: Public Health Agency of Canada. <http://www.phac-aspc.gc.ca/cpho-acsp/cpho-acsp-role-eng.php>

## Definitions of Health

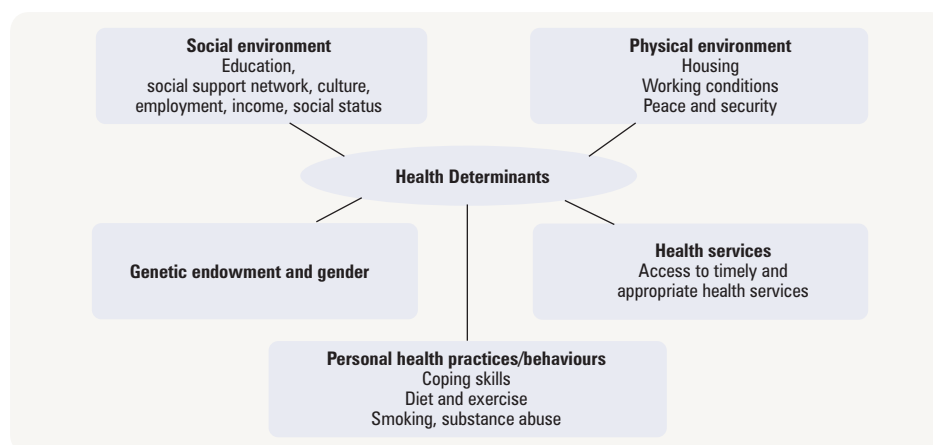

- First multidimensional definition of health, as defined by the WHO in 1948: "A complete state of physical, mental and social well being and not merely the absence of illness"
- WHO updated the definition (socio-ecological definition) of health in 1986: "The ability to identify and to realize aspirations, to satisfy needs, and to change or cope with the environment. Health is therefore a resource for everyday life, not the objective of living. Health is a positive concept emphasizing social and personal resources, as well as physical capacities"
- Other definitions of health have since been proposed that incorporate other dimensions of health (e.g. "Health is a social, economic, and political issue and above all a fundamental human right" – The People's Charter for Health)

## Concepts of Health

- **disease:** abnormal, medically-defined changes in the structure or function of the human body
- **illness:** an individual's experience or subjective perception of a lack of physical or mental well-being and consequent inability to function normally in social roles
- **impairment:** any loss or abnormality of psychological, physiological, or anatomical structure or function
- **disability:** any restriction or lack of ability to perform an activity within the range considered normal for a human being
- **handicap:** the disadvantage for an individual arising due to impairment and disability
  - limits or prevents the fulfillment of an individual's normal role as determined by society and depends on age, sex, social, and cultural factors
  - changes the individual's relationship with the physical and social environment
- **health equity:** when all people have "the opportunity to attain their full health potential" and no one is "disadvantaged from achieving this potential because of their social position or other socially determined circumstance." Differs from health equality
- **health equality:** defined as where populations have equal or similar health status. Health inequities are those which are considered unjust and/or preventable

## Determinants of Health

- 1974: the Honourable Marc Lalonde, federal Minister of Health, presented the health field concept entitled *A New Perspective on the Health of Canadians* which included four areas that interact to determine health: human biology, environment, lifestyle, and health care
- since then this concept has been expanded to include numerous determinants of health (see below)

**Figure 1. Population health model**

Adapted from Dahlgren G, Whitehead M. *Policies and Strategies to Promote Social Equity in Health*. Stockholm: Institute of Future Studies, 1991

## Vulnerable Populations

**Table 2. Health Determinants of Vulnerable Populations**

	Definition	Psychosocial/ Socioeconomic	Physical Environment	Individual Behaviour	Population-Specific Interventions
<b>Aboriginal Peoples</b>	Four specific groups: First Nations Status Indians (registered under the <i>Indian Act</i> ), non-Status Indians, Métis, and Inuit	Low income Family violence Low education status Unemployment Homelessness Longer length of disability	Crowded housing Inefficient ventilation Environmental toxins (botulism) TB declining but prevalence higher than rest of population	Smoking Substance misuse Excessive gambling Poor nutrition Sedentary lifestyle High BMI High risk sexual behaviours	Mental health awareness Aboriginal-specific diabetes initiatives Substance abuse treatment programs

**Table 2. Health Determinants of Vulnerable Populations** (continued)

	Definition	Psychosocial/ Socioeconomic	Physical Environment	Individual Behaviour	Population-Specific Interventions
<b>Seniors</b>	Individuals >65 yr	Elder abuse Lack of emotional support	Low hazard tolerance Institutionalization	Inactivity Polypharmacy Medical co-morbidities	Aging in place of choice Falls and injury prevention Mental health promotion Preventing abuse and neglect
<b>Children in Poverty</b>	Based on Low Income Cut Offs (LICO) LICO is an income threshold below which a family will likely devote a larger share of its income on the necessities of food, shelter and clothing than the average family	Low income Family dysfunction Lack of educational opportunities	Housing availability Unsafe housing Lack of recreational space	Poor supervision Food insecurity High risk behaviours	Improvements in family income most significant Early childhood education
<b>People with Disabilities</b>	Includes impairments, activity limitations, and participation restrictions	Low income Low education status Discrimination	Institutionalization Barriers to access Transportation challenges	Substance misuse Poor nutrition Inactivity Dependency for ADLs	Transportation support Multidisciplinary care Unique support for individuals with specific disabilities (e.g. Trisomy 21)
<b>New Immigrants</b>	Person born outside of Canada who has been granted the right to live in Canada permanently by immigration authorities	Access to community services Cultural perspectives	Diseases and conditions in country of origin (e.g. smoke from wood fires, incidence of TB, etc.)	Employment, ESL Healthy Newcomer Effect (health worsens over time to match that of the general population) Cultural or religious expectations	Women's health Mental health Infectious diseases (syphilis blood test, CXR, HIV) Dental and vision screening Vaccinations Cancer screening
<b>Homeless Persons</b>	An individual who lacks permanent housing	Low income Mental illness	Exposure to temperature extremes Infections such as West Nile Virus	Substance misuse Violence	Safe housing Addictions support Mental health
<b>Refugee Health</b>	Forced to flee country of origin because of a well-founded fear of persecution and given protection by the Government of Canada  <i>Refugee claimant:</i> Arrive in Canada and ask to be considered refugee	Post-traumatic stress disorders Depression Adjustment problems IFH (Interim Federal Health) for refugee claimants, health coverage 1 yr for medical necessities, specifically does not cover screening or preventative care Additionally IFH will restrict coverage for individuals from designated countries of origin (DCO) whose applications were placed after Dec 15, 2012	Diseases and conditions in country of origin (e.g. malaria, TB, onchocerciasis, etc.) Direct and indirect effects of war	Employment ESL Longstanding prior lack of access to health care (chronically neglected problems) Cultural or religious expectations	Vaccinations Women's health Mental health Infectious diseases Dental and vision screening Political advocacy

Note: this chart delineates the major challenges faced by each group, but the issues listed are not unique to each population

#### Determinants of Health

- Income and social status
- Social support networks
- Education and literacy
- Employment and working conditions
- Social environment
- Physical environment
- Personal health practices and coping skills
- Healthy child development
- Biology and genetic endowment
- Health services
- Gender
- Culture

Source: Public Health Agency of Canada

#### New Immigrants to Canada

- Mandatory medical exams on entry to Canada by a designated medical practitioner:
  - Complete medical examination for all persons of all ages
  - Chest x-ray and report for persons 11 yr of age and over
  - Urinalysis for persons 5 yr of age and over
  - Syphilis serology for persons 15 yr of age and over
  - HIV testing for applicants 15 yr of age and over, as well as for those children who have received blood or blood products, have a known HIV-positive mother, or have an identified risk. An ELISA HIV screening test should be done for HIV 1 and HIV 2
  - Serum creatinine if the applicant has hypertension (resting blood pressure greater than 140/90 mmHg), a history of treated hypertension, diabetes, autoimmune disorder, persistent proteinuria, or kidney disorder

Citizenship and Immigration Canada. Handbook.  
<http://www.cic.gc.ca>

#### Example of Primary Prevention: Gardasil Vaccine and its Efficacy in the Prevention of Cervical Cancer

Gardasil® is a quadrivalent HPV vaccine covering strains 6,11,16,18. The efficacy of Gardasil® was studied in 4 randomized, double-blind, placebo controlled trials on females between 16 and 26 yr of age and was found to prevent nearly 100% of precancerous cervical changes for up to 4 yr after vaccination.

#### Example of Primary Prevention: The Obesity Prevention Campaign by the Ontario Medical Association (OMA)

The OMA campaign has involved calls for early action on menu labeling from leaders in the restaurant field, lobbying the provincial government to enact legislation requiring calorie contents to be listed on menus at chain restaurants and school cafeterias, and an education campaign to inform the public about the impact of caloric intake on weight gain and obesity.

Source: Ontario Medical Association. <https://www.oma.org/HEALTHPROMOTION/OBESITY/Pages/default.aspx>

## Disease Prevention

### Disease Prevention Strategies

- measures aimed at preventing the occurrence, interrupting through early detection and treatment, or slowing the progression of disease/mitigating the sequelae

### Primary Prevention

- implemented to prevent disease from occurring
- immunization programs exist in most countries to address major causes of pediatric morbidity and mortality that are preventable by vaccines, e.g. measles, diphtheria, pertussis, tetanus, polio, and tuberculosis (not routine in Canada or the U.S.)

- additional immunizations are offered in Canada depending on jurisdiction: mumps, rubella, rotavirus, hepatitis B, *Haemophilus influenzae* type B, varicella, HPV, conjugated pneumococcal and meningococcal vaccines (see [Pediatrics, P3](#))

### Secondary Prevention (Screening)

- presumptive identification (not diagnosis) of unrecognized disease or defect by the application of tests, examinations, or other procedures which can be applied rapidly
- **types of screening**
  - mass screening: screening all members of a population for a disease (e.g. phenylketonuria (PKU) and hypothyroidism in all newborns)
  - selective screening: screening of a specific subgroup of the population at risk for a disease (e.g. mammography in women >50 yr old)
  - multiphasic screening: the use of many measurements and investigations to look for many disease entities (e.g. periodic health exam)

**Table 3. Ideal Criteria for Screening Tests**

Disease	Test	Health Care System
Causes significant suffering and/or death Natural history must be understood Must have an asymptomatic stage that can be detected by a test Early detection and intervention must result in improved outcomes Incidence is not too high or too low	High specificity and sensitivity Safe, rapid, easy, relatively inexpensive Acceptable to providers and to population	Adequate capacity for reporting, follow-up, and treatment of positive screens Cost effective Sustainable program Clear policy guidelines

### Tertiary Prevention

- treatment and rehabilitation of disease after it has been diagnosed so as to prevent progression and permanent disability (e.g. HbA1c, eye, and foot monitoring for diabetes)

## Health Promotion Strategies

**Table 4. Disease Prevention versus Health Promotion Approach**

Disease Prevention	Health Promotion
Health = absence of disease	Health = positive and multidimensional concept
Medical model (passive role)	Participatory model of health
Aimed mainly at high-risk groups in the population	Aimed at the population in its total environment
Concerns a specific pathology	Concerns a network of issues
One-shot strategy	Diverse and complementary strategies
Directive and persuasive strategies	Facilitating and enabling approaches
Directive measures enforced in target groups	Incentive measures offered to the population
Focused mostly on individuals and groups of subjects	Focused on a person's health status and environment
Preventive programs considered the affairs of professional groups from health disciplines	Non-professional organizations, civic groups, local, municipal, regional, and national governments necessary for achieving the goal of health promotion

Source: Shah CP. Public Health and Preventive Medicine in Canada. Toronto: Elsevier, 5th edition, 2003

### Healthy Public Policy

- characterized by an explicit concern for health and equity in all areas of policy and by an accountability for health impact
- main aim: to create a supportive environment to enable people to lead healthy lives, thereby making healthy choices easier for citizens
- government sectors must take into account health as an essential factor when formulating policy and should be accountable for the health consequences of their policy decisions
- methods:
  - fiscal: imposing additional costs (e.g. taxes on tobacco and alcohol)
  - legislative: implementing legal deterrents (e.g. smoking bans, legal alcohol drinking age)
  - social: improving health beyond providing universally funded health care (e.g. providing affordable housing)

Source: International Conference on Health Promotion, Adelaide, South Australia (1998)

### Community Development

- process of community members identifying issues and problems affecting their community and subsequently developing the skills and capacity to implement change

#### Disease Prevention Strategies

- **Primary:** before disease occurs (e.g. immunizations, seatbelt use, smoking cessation programs for lung cancer prevention)
  - **Secondary:** early detection of disease (e.g. mammography, routine Pap smears)
  - **Tertiary:** treatment and rehabilitation of existing disease (e.g. ACE inhibitor for hypertension)
- Within these three stages of prevention there can be both:
- **Passive prevention:** measures that operate without the person's active involvement (e.g. airbags in cars)
  - **Active prevention:** measures that a person must do on their own (e.g. wearing a seatbelt)

#### Ottawa Charter for Health Promotion (1986)

- Governments and health care providers should be involved in a health promotion process that includes:
  - Building healthy public policy
  - Creating supportive environments
  - Strengthening community action
  - Developing personal skills
  - Re-orienting health services

#### Jakarta Declaration on Health Promotion into the 21st Century (WHO 1997)

- Reiterated the commitment to health promotion
- First of the health promotion conferences to involve the private sector
- Formally cited poverty as the greatest threat to health
- Priorities for health promotion:
  - Promote social responsibility for health
  - Increase investments for health development
  - Consolidate and expand partnerships for health
  - Increase community capacity and empower the individual
  - Secure an infrastructure for health promotion

#### Labonte's Model of Community Development

- Personal empowerment
- Small group development
- Community organization
- Coalition advocacy
- Political action

#### 4 Ps Influencing Health Marketing

- Product:** good health
- Price:** what a person must give up if he or she accepts the product "pursuing good health"
- Place:** the distribution channels used to reach the consumer (e.g. distributing pamphlets at the doctor's office)
- Promotion:** the way in which the product is promoted to the consumer

### Community-Based Prevention

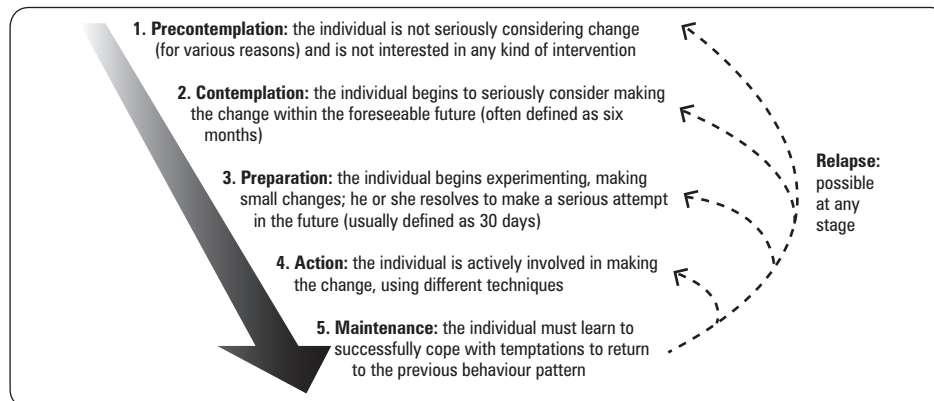

- public health service (prevention or promotion) focused on an entire community as opposed to only high-risk groups/individuals
- “community-based approaches” are population-based multifactorial initiatives that make use of community organization and social marketing to elicit change at the community level (e.g. *Saskatoon's In Motion program* – see sidebar)
- numerous preventable risk factors are addressed by multiple health promotion strategies

### Health/Social Marketing

- application of the principles of commercial marketing to promote healthy changes
- involves target group analysis and segmentation of the market for specific messages and promotion strategies
- employed by both the health system (e.g. pamphlets providing health information about HIV) and by industry (e.g. in medication advertisements)

### Behaviour Change

- health education serves to:
  - increase knowledge and skills
  - encourage positive behaviour changes and discourage unhealthy choices
- health education is an important component of eliciting behaviour change
- behaviour is a result of three factors
  1. predisposing factors: knowledge, attitude, beliefs, values, intentions
  2. enabling factors: skills, supports
  3. reinforcing factors: health care professionals and the social context of family and community
- **Health Belief Model** (1975)
  - behaviours undertaken by individuals in order to remain healthy are a function of a set of interacting beliefs
  - beliefs include an individual's perception of his or her susceptibility to a disease, the severity of the disease, and the benefits and costs of health-related actions
  - beliefs are modified by socio-demographic and psychosocial variables
  - individuals must believe that the action will have positive consequences
  - individuals must be in a state of readiness
  - behaviour can be stimulated by cues to action, which are specific events that can encourage preventive health decisions and actions (e.g. physician recommendation, public advertising)
- **Stages of Change Model**
  - provides a framework in which the Health Belief Model is applied to facilitating behaviour change (e.g. quitting smoking)

**Figure 2. Stages of change model**

Source: Prochaska JO, DeClement CC, and Norcross JC. In Search of How People Change. Applications to Addictive Behaviours. Am Psychol 1992;47:1102-1114

### Risk Reduction Strategies

- **risk reduction:** lower the risk to health without eliminating it (e.g. avoiding sun to lower risk of skin cancer)
- **harm reduction:** tolerance of some degree of risk behaviour, while aiming to minimize the adverse outcomes associated with these behaviours (e.g. needle exchange programs)

### Innovation-Diffusion Theory

- theory that describes the process by which health promotion efforts spread in populations
- aims to identify the most effective methods of health promotion within a population
- **Roger's diffusion theory** illustrates the following hierarchy within populations:
  - innovators
  - early adopters (community leaders)
  - early majority
  - late majority
  - laggards

**Saskatoon's In Motion** is a community-based strategy to increase physical activity through collaborative community efforts. 98% of all Saskatoon schools have now committed to meeting In Motion goals, including at least 30 min of daily physical activity per child. Elementary schools also report that students are active on one additional day per week compared to pre-program activity levels. In Motion is viewed as a best practice strategy and is now being implemented in communities and provinces across Canada.

Chief Public Health Officer's Report, 2009.

#### Example of Harm Reduction Strategy Summary of Findings from the Evaluation of a Pilot Medically Supervised Safer Injecting Facility

CMAJ 2006;175:1399-1404

**Background:** This study discusses the outcomes among a population of illicit injection drug users (IDUs) after initiating a supervised safe injecting facility in Vancouver, September 2003. Legal exemption by the Canadian government was granted such that an evaluation of its results be conducted over a 3 yr period.

**Study Population:** IDUs of the Vancouver area were allowed to inject previously obtained illicit drugs under the supervision of nurses and physicians. IDUs were offered addiction counseling and supports for appropriate community resources. A random sample of 670 IDUs was recruited and monitored from Dec 2003-July 2004.

**Results:** Characteristics of IDUs who used the safe injecting facility included age <30 yr, history of public drug use, homelessness, daily heroin and/or cocaine injection, and recent history of overdose. Mean measures of public order problems were taken 6 wk before and 12 wk after initiation of the safer injection facility. It was found that the mean number of IDUs injecting daily in public, along with the mean number of publicly discarded syringes were reduced by approximately half.

**Conclusions:** Overall it has been found that the safer injection facility in Vancouver has been successful in attracting IDUs at increased risk of HIV, overdose, and public injection of substances. This has resulted in lower incidences of public drug use, publicly discarded syringes and sharing of needles. Other studies associated with this one have demonstrated that there has been no increase in the drug dealing, drug related crimes, or rates of new IDUs in the area surrounding the safer injecting facility.

#### Characteristics of Innovations that Influence Positive Adaptability of the Change

- Simple
- Workable
- Reversible
- Flexible
- Advantageous
- Cost effective
- Low risk
- Compatible with value systems

# Measurements of Health and Disease in a Population

## Life Expectancy

- the expected number of years that an individual will live based on standardized death rates for the population
- usually qualified by country, gender, and age

## Crude Death Rate

- mortality rate from all causes of death per 1000 in the population

## Age Standardized Rate

- adjustment of the crude rate of a health-related event using a "standard" population
- standard population is one with a known number of persons in each age and sex group (e.g. the 1991 census data for Canada using 5-yr age intervals for males and females)
- standardization prevents bias which could be made by comparing crude rates from two dissimilar populations (e.g. crude death rates over a number of decades are not comparable as the population age distribution has changed with time)

## Standardized Mortality Rate

- the ratio of the observed (actual) number of deaths to the expected number of deaths for a group (e.g. age, race, gender, etc.)
- useful for comparing populations that are significantly different in some aspect (e.g. the causes of death in more and less developed countries)

## Infant Mortality Rate (IMR)

- number of deaths among children under 1 yr of age reported during a given time period divided by the number of live births reported during the same time period and expressed per 1000 live births per year

## Maternal Mortality Rate (MMR)

- number of deaths of women during pregnancy and due to puerperal causes per 100,000 live births per year

## Proportional Mortality Ratio (PMR)

- proportion of all deaths in a specified population over a given period of time attributable to a specific cause
  - each cause is expressed as a percentage of all deaths, with the sum of all causes adding to 100%

## Potential Years of Life Lost (PYLL)

- calculated for a population using the difference between the actual age at death and a standard/expected age at death
- increased weighting of mortality at a younger age

## Disability Adjusted Life Year (DALY)

- quantitative indicator of the burden of diseases that reflects the total amount of disability-free life years lost
- includes loss from premature mortality and loss due to a degree of disability over a specific period of time; these disabilities can be physical or mental

## Quality Adjusted Life Year (QALY)

- a value from 0 to 1 assigned to a yr of life based on perceived quality of life; a yr in "perfect" health is considered equal to 1 QALY, the value of a yr in ill health would be lowered based on the burden of disease
- it is possible to have "states worse than death" for example QALY <0 for extremely serious conditions

### Top 5 Causes of Mortality in Canada, 2012, by Sex

#### Female

- Cancer
- Heart disease
- Stroke
- COPD/chronic lower respiratory disease
- Alzheimer's

#### Male

- Cancer
- Heart disease
- Accidents
- Stroke
- COPD/chronic lower respiratory disease

Source: Statistics Canada. *CANSIM*, 2012. table 102-0561 and 102-0562 and catalogue no.84-215-X.

# Epidemiology

## Population

- a collection of individuals who share a common trait (most commonly applied to a geographic area but it could be another factor such as ethnic group)

### Sample

- a selection of individuals from a population or set of observations
- types:
  - random: all are equally likely to be selected
  - systematic: an algorithm is used to select a subset
  - stratified: separate representations of more than one subgroup
  - cluster: grouped in space/time to reduce costs
  - convenience: non-random inclusion, usually volunteers

### Sample Size

- sample size contributes to the statistical precision of the observed estimate
- increasing the sample size decreases the probability of type I and type II errors (see PH14)

### Bias

- non-random error leading to a deviation of inferences or results from the truth
- any trend in the collection, analysis, interpretation, publication, or review of data that can lead to conclusions that are systematically different from the truth
  - **lead-time:** time between early diagnosis with screening and when diagnosis would have been made without screening
  - **lead-time bias:** over-estimation of survival when the estimate is made from the time of screening, instead of the later time when the disease would have been diagnosed without screening (see Figure 3)
  - **incidence-prevalence bias:** when prevalent cases include long-term survivors who have a better prognosis than some incident cases
  - **length-time bias:** overestimation of the survival time due to the sampling of prevalent as opposed to incident cases
    - ♦ selection of prevalent cases will favour the over-inclusion of longer-living cases rather than newly-diagnosed incident cases, some of whom may have short survival times
  - **sampling bias:** occurs with the selection of a sample that does not truly represent the population
    - ♦ sampling procedures should be chosen to prevent or minimize bias
  - **recall bias:** when individuals with a disease are more prone to recalling or believing they were exposed to a possible causal factor than those who are free of disease

Figure 3. Lead time bias

### Confounder

- a variable that is related to both the exposure and outcome but is not measured or is not distributed equally between groups
- distorts the apparent effect of an exposure or risk because it may not be possible to separate/control for the contribution of a single causal factor to an effect (e.g. late maternal age could be a confounder in an investigation of birth order >4 and risk of developing Trisomy 21)

### Prevalence

- total number of cases in a population over a defined period of time (see sidebar)
- two forms of prevalence
  - **point prevalence:** attempts to measure the frequency of all disease at one specific point in time, therefore knowledge of the time of onset of disease is not required
  - **period prevalence:** measure constructed from prevalence at a point in time, plus new cases and recurrences over a defined period of time
- depends on **incidence rate** (see sidebar) and disease duration from onset to termination (cure or death)
- favours the inclusion of chronic over acute cases and may be used to present a biased picture of the disease
- prevalence studies are cross-sectional and cannot be used for causal inferences
- prevalence figures are useful for determining the extent of a disease and can aid in the rational planning of facilities and services

### Sensitivity

- proportion of people with disease who are correctly identified by a positive test

### Specificity (refer to sidebar)

- proportion of people without disease who are correctly identified by having a negative test

#### Incidence and Prevalence

**Incidence** =  $\frac{\text{number of new cases of disease in a time interval}}{\text{total population at risk} \times [\text{per unit population (e.g. 100 000)}]}$   
(measures the rate of new infections)

**Prevalence** =  $\frac{\text{number of existing cases of disease at a point in time}}{\text{total population} \times [\text{per unit population (e.g. 100 000)}]}$   
(measures the frequency of disease at a point in time)

**SPIN:** use a **SP**ecific test to rule **IN** a hypothesis. Note that specific tests have very few false positives. If you get a positive test, it is likely a true positive.

**SNOUT:** use a **SEN**sitive test to rule **OUT** a hypothesis. Note that sensitive tests have very few false negatives. If you get a negative test, it is likely a true negative.

TP = True positive TN = True negative FP = False positive FN = False negative

		Disease	
		Present	Negative
Test Result	Positive	TP	FP
	Negative	FN	TN

#### Likelihood Ratio (LR)

- Likelihood that a given test result would be expected in a patient with disease compared with the likelihood that the same result would be expected in a patient without disease
- LR+ indicates how much the probability of disease increases if the test is positive
- LR- indicates how much the probability of disease decreases if the test is negative

$$LR+ = \frac{\text{Sensitivity}}{1 - \text{Specificity}} = \frac{[TP/(TP+FN)]}{[FP/(TN+FP)]}$$

$$LR- = \frac{1 - \text{Sensitivity}}{\text{Specificity}} = \frac{[FN/(TP+FN)]}{[TN/(TN+FP)]}$$

#### Positive Predictive Value (PPV)

- Proportion of people with a positive test who have the disease

$$PPV = \frac{TP}{TP + FP}$$

#### Negative Predictive Value (NPV)

- Proportion of people with a negative test who are free of disease

$$NPV = \frac{TN}{TN + FN}$$

#### Pre-test Probability

- An estimate of the likelihood a particular patient has a given disease based on known factors such as clinical assessment prevalence of disease In the population. Together with a post-test probability this can be used to interpret a diagnostic test or a series of tests

$$\text{Pre-test Odds} = \frac{\text{Prevalence}}{1 - \text{Prevalence}}$$

#### Post-test Probability

- A revision of the probability of disease after a patient has been examined or a diagnostic test has been conducted
- Calculation process can be more explicit using results from epidemiologic studies, knowledge of the accuracy of tests and Bayes' theorem
- The post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
- After each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

$$\text{Post-test Odds} = \text{Pre-Test Odds} \times \text{LR}$$

$$\text{Post-test Probability} = \frac{\text{Post-test odds}}{\text{Post-test odds} + 1}$$

#### Intention-To-Treat (ITT)

- a strategy for analyzing data in which all participants are included in the group to which they were assigned, whether or not they completed the requirements of that group
- this is to limit the bias introduced by issues of compliance and to simulate real world situations in which not all patients/providers adhere to the study allocation protocol

#### Relative Risk (RR)

- ratio of the incidence of a health outcome among the exposed population to the incidence of the health outcome in the non-exposed population

$$\text{Relative Risk (RR)} = \frac{PPV}{1 - NPV} = \frac{[TP/(TP+FP)]}{[FN/(TN+FN)]}$$

#### Attributable Risk (AR)

- rate of a health outcome attributable to a hypothetical risk factor for that outcome
- [incidence in exposed population] - [incidence in non-exposed]
- attributable risk assumes causation

$$\text{Attributable Risk} = PPV - (1 - NPV) \\ = [TP/(TP+FP)] - [FN/(TN+FN)]$$

		Advanced Neoplasia	
		Present	Negative
Test Result	Positive	68	147
	Negative	216	2234
	Total	284	2381

$$\text{Sensitivity} = 68/284 = 23.9\%$$

$$\text{Specificity} = 2234/2381 = 93.8\%$$

$$LR+ = \frac{0.239}{1 - 0.938} = 3.85$$

$$LR- = \frac{1 - 0.239}{0.938} = 0.81$$

$$PPV = \frac{68}{(68 + 147)} = 31.6\%$$

$$NPV = \frac{2234}{(2234 + 216)} = 91.2\%$$

**Figure 4. Understanding sensitivity and specificity**

**Figure 4a. Hypothetical population**

**Figure 4b. Results of diagnostic test on hypothetical population**

**Figure 4c. Sensitivity of test (e.g. 24/30 = 80% sensitive)**

**Figure 4d. Specificity of test (e.g. 56/70 = 80% specific)**

Source: Loong TW. Understanding sensitivity and specificity with the right side of the brain. *BMJ* 2003;327:716-719

**Figure 5. Clinical epidemiology definitions and practical example using FOBT testing in advanced colon cancer**

### Pre-test Probability

- an estimate of the likelihood a particular patient has a given disease based on known factors

### Post-test Probability

- a revision of the probability of disease after a patient has been interviewed and examined
- calculation process can be more explicit using results from epidemiologic studies, knowledge of the accuracy of tests, and Bayes' theorem
- the post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
  - after each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

Numbers from Collins J, Lieberman D, Durbin T, Weiss D. Accuracy of Screening for Fecal Occult Blood on a Single Stool Sample Obtained by Digital Rectal Examination: A Comparison with Recommended Sampling Practice. *Ann Intern Med* 2005;142:81-85

		Disease (e.g. lung CA)		
		Present	Absent	Total
Exposure (e.g. smoking)	Present	A	B	A + B
	Absent	C	D	C + D
	Total	A + C	B + D	A + B + C + D

**Case-Control Study**

$$\text{odds ratio (OR)} = \frac{A}{B} \div \frac{C}{D} = \frac{A \times D}{B \times C}$$

**Cohort Study**

$$\frac{A}{A+B} = \text{incidence rate of disease in smokers} \quad \frac{C}{C+D} = \text{incidence rate of disease in non-smokers}$$

$$\text{relative risk (RR)} = \frac{A}{A+B} \div \frac{C}{C+D} \quad \text{attributable risk (AR)} = \frac{A}{A+B} - \frac{C}{C+D}$$

Sensitivity and specificity are characteristics of the test.

LR depends on the test characteristics, not the prevalence.

PPV and NPV depend on the prevalence of the disease in the population.

Figure 6. Results tabulation by study design

## Effectiveness of Interventions

### DEFINITIONS

#### Relative Risk Reduction (RRR)

- proportional reduction in rates of adverse outcomes between experimental and control participants in a trial

#### Absolute Risk Reduction (ARR)

- absolute arithmetic difference in rates of adverse outcomes between experimental and control participants in a trial
- it is hypothesized that events will occur more often in control group than in experimental group where the intervention is protective (e.g. a vaccine)

#### Absolute Risk Increase (ARI)

- absolute arithmetic difference in rates of adverse outcomes between control and experimental participants in a trial
- it is hypothesized that events will occur more often in experimental group than in control group when the intervention is harmful (e.g. alcohol excess)

#### Number Needed to Treat (NNT)

- number of patients who need to be treated to achieve one additional favourable outcome
- only one of many factors that should be taken into account in clinical or health system decision making (e.g. must take into account cost, ease, feasibility, etc. of intervention)
  - a condition with death as a potential outcome can have a higher NNT (and be acceptable), as compared to an intervention to prevent an outcome with low morbidity, in which a low NNT would be necessary

#### Number Needed to Harm (NNH)

- number of patients who, if they received the experimental treatment, would lead to one additional patient being harmed, compared with patients who received the control treatment

#### Adherence (formerly compliance)

- degree to which a patient follows a treatment plan

#### Equations to Assess Effectiveness

CER = control group event rate  
 EER = experimental group event rate  
 $RRR = (CER - EER)/CER$   
 $ARR = CER - EER$   
 $ARI = EER - CER$   
 $NNT = 1/ARR$   
 $NNH = 1/ARI$

#### Beware:

Do not be swayed by a large RRR, as it may appear to be large if event rate is small to begin with. In these cases ARR is more important (e.g. a drug which lowers an event which occurs in 0.1% of a population to 0.05% can boast a RRR of 50%, and yet the ARR is only 0.05%, which is not nearly as impressive).

### Effectiveness, Efficacy, Efficiency

- three measurements indicating the relative value (beneficial effects vs. harmful effects) of an intervention
  - **efficacy:** the extent to which a specific intervention produces a beneficial result under ideal conditions
    - ♦ ideally, based on the results of a randomized control trial (the theoretical impact)
  - **effectiveness:** measures the benefit of an intervention under usual conditions of clinical care
    - ♦ considers both the efficacy of an intervention and its actual impact on the real world, taking into account access to the intervention, whether it is offered to those who can benefit from it, its proper administration, acceptance of intervention, and degree of adherence to intervention
  - **efficiency:** a measure of economy of an intervention with known effectiveness
    - ♦ considers the optimal use of resources (e.g. money, time, personnel, equipment, etc.)

## Types of Study Design

### Qualitative vs. Quantitative

Table 5. Qualitative vs. Quantitative Study Designs

Qualitative	Quantitative
Generates hypothesis (Why? What does it mean?)	Tests hypothesis (What? How much/many?)
Inductive (specific to general): "bottom up" Observation → pattern → tentative hypothesis → theory	Deductive (general to specific): "top down" Theory → hypothesis → observation → confirmation
Sampling approach to obtain representative coverage of ideas or concepts	Sampling approach to obtain representative coverage of people in the population
Narrative: rich, contextual, and detailed information from a small number of participants	Numeric: frequency, severity, and associations from a large number of participants

Source: Adapted from <http://phprimer.afmc.ca>

### Quantitative Research Methods

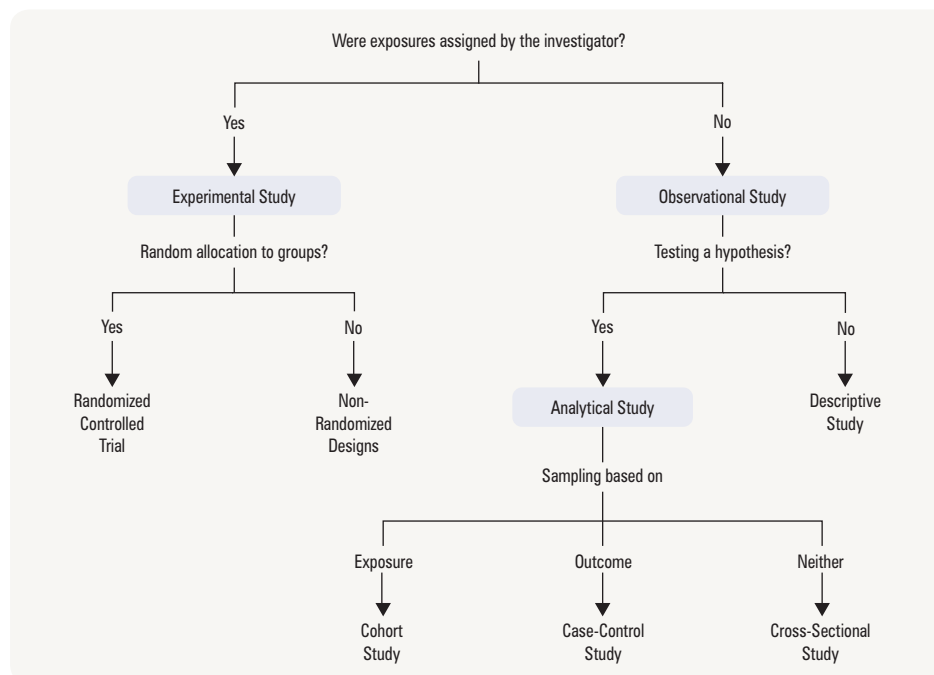

Figure 7. Quantitative study designs

Source: Adapted from <http://phprimer.afmc.ca>

## Observational Study Designs

- observational studies involve neither the manipulation of the exposure of interest nor randomization of the study subjects
- there are two main subtypes of observational studies: descriptive and analytic studies

### Descriptive Studies

- describe the events and rates of disease with respect to person, place and time and to estimate disease frequency and time trends
- first sets of studies and are used to generate an etiologic hypothesis, not test a hypothesis

### Analytic Studies

- observational studies used to test a specific hypothesis
- includes ecological studies, cohort studies, case-control studies, and cross-sectional studies

**Table 6. Observational Study Designs**

Type of Study	Ecological	Cross-Sectional	Case-Control (Figure 8)	Cohort (Figure 9)
<b>Definition</b>	Units of analysis are populations or groups of people, rather than individuals	Assessment of individuals with respect to presence and absence of exposures and diseases at the same point in time	Samples a group of people who already have a particular outcome (cases) and compares them to a similar sample group without that outcome (controls)	Subjects are sampled and, as a group, classified on the basis of presence or absence of exposure to a particular risk factor
<b>Subjects</b>	Population (e.g. geographic areas)	Population (sample)	Two study sample populations are compared: cases and controls	One or more cohorts Cohort: group of people with common characteristics (e.g. year of birth) Divided into measured exposed vs. non-exposed groups
<b>Methods</b>	Accurate descriptions of the average exposure or risk of disease for a population	Collect information from each person at one particular time Tabulate the numbers in groups (e.g. by presence or absence of disease/factor of interest) Make 2 x 2 table and compare groups Estimate prevalence	Ask cases and controls about exposures Select all the cases of a specific disease during a specific time frame Representative of spectrum of clinical disease Select control(s) Represent the general population To minimize risk of bias, may select more than one control group and/or match controls to cases (e.g. age, gender) Association can be concluded between the risk factor and the disease (odds ratio) Estimate incidence	Subjects are followed for a specific period of time to determine development of disease in each exposure group Prospective: measuring from the exposure to the future outcomes – looking forward Retrospective: measuring from outcomes to possible risk factors or protective factors – looking back  Collect information on factors from all persons at the beginning of the study Tabulate the number of persons who develop the disease or other measured outcomes of morbidity Provides estimates of incidence, relative risk, attributable risk
<b>Advantages</b>	Quick, easy to do Uses readily available data Generates hypothesis	Determines association between variables Quick and uses limited resources Surveys with validated questions allows comparison between studies	Used when disease in population is rare (less than 10% of population) due to increased efficiency Less costly and time consuming	Shows an association between a factor and an outcome/several outcomes Stronger evidence for causation
<b>Disadvantages</b>	Poor generalizability to individual level (not direct assessment of causal relationship) Ecological fallacy: an incorrect inference about individuals in the population	Does not allow for assessment of temporal relationship or causation between variables Recall bias (see PH8)	Recall bias (see PH8) Confounding Selection bias for controls Only one outcome can be measured	By itself, cannot establish causation Confounding factors are common as the cohort self-selects the exposure, or unknown/unmeasured factors are associated with the measured exposure Cost and duration of time needed to follow cohort

An example of a descriptive study is one that explores the rates of AIDS by age, sex, geographic distribution, and over time.

### Formulating a Research Question

#### PICO

**P**atient Characteristics

**I**ntervention of Interest

**C**omparison Group or Control Group

**O**utcome that you are trying to prevent or achieve

An example of an ecological study would be one looking at the association between smoking rates and lung cancer rates in different countries.

An example of an ecological fallacy would be concluding that red wine drinking leads to lower risk of death from CVS disease after an ecological study shows that France has a higher rate of red wine consumption and a lower rate of death from CVS causes.

An example of a cross sectional study is one that examines the distribution of BMI by age in Ontario at a particular point in time.

An example of a famous case control study is by Sir Richard Doll who demonstrated the link between tobacco smoking exposure and lung cancer cases.

An example of a famous cohort study is the Framingham Heart Study, which assesses the long-term cardiovascular risks of diet, exercise, medications such as Aspirin®, etc.

## Experimental Study Designs

- not discussed here are non-randomized control trials (e.g. allocation by clinic or other non-random basis – performed when randomization is not possible) and clinical trials (test treatments or laboratory tests in human subjects)

### 1. RANDOMIZED CONTROLLED TRIAL (RCT)

#### Definition

- subjects are assigned by random allocation to two or more groups, one of which is the control group, the other group(s) receive(s) an experimental intervention

#### Subjects

- individuals are separated into groups by a random process to ensure as much as possible equal distribution of known and unknown factors except for the experimental exposure (e.g. the treatment)

#### Methods

- random allocation of individuals into two or more treatment groups through a centralized concealed process
- method of assessment to reduce bias
  - single-blind:** subject does not know group assignment (intervention or placebo)
  - double-blind:** subject and observer both unaware of group assignment
  - triple-blind:** subject, observer, and analyst unaware of group assignment (rarely done)
- one group receives placebo or standard therapy
- one or more groups receive(s) the intervention(s) under study
- the outcome is measured and the groups are compared
- all other conditions are kept the same between groups

#### Advantages

- “gold standard” of studies, upon which the practice of EBM is founded
- provides the strongest evidence for effectiveness of intervention
- with sufficient sample size and appropriate randomization, threats to validity are minimized
- allows prospective assessment of the effects of intervention while minimizing bias

#### Disadvantages

- some exposures are not amenable to randomization (e.g. cannot randomize subjects to poverty/wealth or to harmful exposures such as smoking) due to ethical or feasibility concerns
- difficult to randomly allocate groups (e.g. communities, neighbourhoods)
- difficult to study rare events, since RCTs would require extremely large sample sizes
- costly

## Other Study Designs

### 1. META-ANALYSIS

#### Definition

- combines the results of independent (studies identified through a systematic review) that address a common research hypothesis into one large study

#### Subjects

- combination of all the subjects used in original studies

#### Methods

- selection of relevant studies from the published literature which meet quality criteria
- statistical models used to combine the results of each independent study
- provides a summary statistic of overall results as well as graphic representation of included studies

#### Advantages

- attempts to overcome the problem of reduced power due to small sample sizes of individual studies
- ability to control for inter-study variation

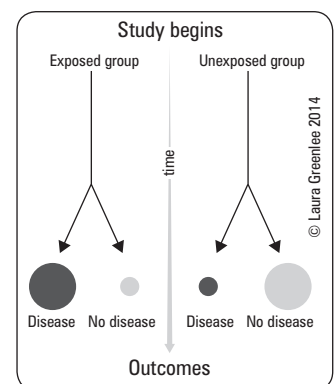

#### Disadvantages

- sources of bias may not be controlled for
- reliance on published studies may increase the potential conclusion of an effect as it can be difficult to publish studies that show no significant results (publication bias)
- the decision to include/reject a particular study is subjective

**Figure 8. Case-control study**

Adapted from <http://phprimer.afmc.ca>

**Figure 9. Cohort study**

Adapted from <http://phprimer.afmc.ca>

An example of an RCT is the SPARCL trial, which demonstrated intense lipid-lowering with atorvastatin reduces the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis when compared to placebo.

An example of a meta-analysis is one that includes the full set of reported studies based on compiling and analyzing data from eligible RCTs, which compare the effects of ACE inhibitors, CCBs, and other antihypertensive agents on mortality and major cardiovascular events.

# Methods of Analysis

## Distributions

- distribution describes the probability of events
- normal (Gaussian) or non-normal (skewed, bimodal, etc.)
- characteristics of the normal distribution
  - mean = median = mode
  - 67% of observations fall within one standard deviation of the mean
  - 95% of observations fall within two standard deviations of the mean
- measures of central tendency
  - **mean:** sum of all observations divided by total number of variables
  - **median:** value at the 50th percentile, this is a better reflection of the central tendency for a skewed distribution
  - **mode:** most frequently observed value in a series
- measures of dispersion
  - **range:** the largest value minus the smallest value
  - **variance:** a measure of the spread of data
  - **standard deviation:** the average distance of data points from the mean (the positive square root of variance)
- given the mean and standard deviation of a normal or binomial distribution curve, a description of the entire distribution of data is obtained

Figure 10. Distribution curves

### Example Calculation

Data set: 17, 14, 17, 10, 7

Mean =  $(17 + 14 + 17 + 10 + 7) \div 5 = 13$

Median (write the list in order, median is the number in the middle)  
= 7, 10, 14, 17, 17 = 14

Mode (number repeated more often)  
= 17

Range =  $17 - 7 = 10$

Variance =  $[(17 - 13)^2 + (14 - 13)^2 + (17 - 13)^2 + (10 - 13)^2 + (7 - 13)^2] \div 5 = 19.5$

Standard Deviation =  $\sqrt{\text{variance}} = \sqrt{19.5} = 4.42$

### Type I ( $\alpha$ ) Error

"There Is An Effect" where in reality there is none.

## Data Analysis

### Statistical Hypotheses

- **null ( $H_0$ )**
  - no relationship exists between the two stated variables (i.e. no association between the hypothesized exposure and the outcome)
- **alternative ( $H_1$ )**
  - a relationship does exist between the two stated variables

### Type I Error ( $\alpha$ Error)

- the null hypothesis is falsely rejected (e.g. concluding an intervention X is effective when it is not, or declaring an observed difference to be real rather than by chance)
- the probability of this error is denoted by the p-value
- studies tend to be designed to minimize this type of error, since a type I error can have larger clinical significance than a type II error

### Type II Error ( $\beta$ Error)

- the null hypothesis is falsely accepted (e.g. stating intervention X is not effective when it is, or declaring an observed difference/effect to have occurred by chance when it is present)
- higher level of error is acceptable for most studies
- can also be used to calculate statistical power

### Power

- probability of correctly rejecting a null hypothesis when it is in fact false (i.e. the probability of finding a specified difference to be statistically significant at a given p-value)
- power increases with an increase in sample size
- power =  $1 - \beta$ , and is therefore equal to the probability of a true positive result

### Statistical Significance

- the probability that the statistical association found between the variables is due to random chance alone (i.e. that there is no association)
- the preset probability is set sufficiently low that one would act on the result; frequently  $p=0.05$
- when statistical tests result in a probability less than the preset limit, the results are said to be statistically significant (i.e.  $p < 0.05$ )

### Clinical Significance

- measure of clinical usefulness (e.g. 1 mmHg BP reduction may be statistically significant, but may not be clinically significant)
- depends on factors such as cost, availability, patient compliance, and side effects in addition to statistical significance

### Trend

- an observed directional relationship that does not meet criteria for statistical significance and thus should be interpreted with caution

### Confidence Interval (CI)

- provides a range of values within which the true population result (e.g. the mean) lies
- frequently reported as 95% CI (e.g. one can be 95% certain that the true value is within this data range)
- bounded by the upper and lower confidence limits

A wider confidence interval implies more variance than a tighter confidence interval.

### Data

- information collected from a sample of a population
- there are 2 overall classes of data listed with examples:
  - **discrete**
    - ♦ categorical (e.g. gender, marital status)
    - ♦ ordinal (e.g. low, medium, high)
  - **continuous** (e.g. serum cholesterol, hemoglobin, age)

### Accuracy

- how closely a measurement approaches the true value

### Reliability

- how consistent a measurement is when performed by different observers under the same conditions or by the same observer under different conditions

### Validity

- extent to which a measurement approaches what it is designed to measure
- determined by the accuracy and reliability of a test

### Internal Validity

- degree to which the findings of the sample truly represent the findings in the study population
- dependent on the precision and accuracy

### External Validity

- degree to which the results of the study can be generalized to other situations or populations

Figure 11. Accuracy vs. reliability

## Common Statistical Tests

Table 7. Statistical Tests

	Z-Test (known as t-test for samples <30)	Analysis of Variance (ANOVA)	Chi-square Test ( $\chi^2$ )	Linear Regression	Logistic Regression
What are you trying to show?	Compare the mean values of an outcome variable between two groups (e.g. difference in average BP between men and women)	Compare the mean values of an outcome variable between two or more groups (e.g. difference in average BP between persons in three towns)	Test the correspondence between a theoretical frequency distribution and an observed frequency distribution. (e.g. if one sample of 20 patients is 30% hypertensive and another comparison group of 25 patients is 60% hypertensive, a chi-squared test determines if this variation is more than expected due to chance alone)	Looks at associations between two or more continuous variables (e.g. age and blood pressure)	Show how a change in one explanatory variable affects the status (e.g. ill vs. non-ill) of the outcome variable
What kind of data do you have in your study?	Data on two groups	Mean of groups (one or more) Overall mean of an entire sample	Data on two or more populations and two or more outcome measures	Data on at least one population	Data on at least one population
What kind of variables do you measure?					
Dependent variable	Continuous data	Continuous data	Categorical (2 or more)	Continuous	Categorical (discrete outcomes usually dichotomous)
Independent variable	Categorical (2 only)	Categorical (2 or more)	Categorical (2 or more)	Continuous	Continuous/categorical
Assumptions		"Normal" distribution	None	Dependent variable has "normal" distribution Linear relationship between variables	None

## Causation

### Criteria for Causation (Sir Bradford Hill)

1. **strength of association:** the frequency with which the factor is found in the disease and the frequency with which it occurs in the absence of disease
2. **consistency:** is it the same outcome with different populations or study design?
3. **specificity:** is the association particular to your intervention and measured outcome?
4. **temporal relationship:** did the exposure occur before the onset of the disease?
5. **biological gradient:** finding a quantitative relationship between the factor and the frequency (e.g. dose response relationship)
6. **biological plausibility:** does the association/causation make biological sense?
7. **coherence:** can the relationship be explained/accounted for based on what we know about the laws of science, logic, etc.?
8. **experimental evidence:** experiment that investigates what happens when the suspected offending agent is removed (e.g. is there improvement?)
9. **analogy:** do other established associations provide a model for this type of the relationship?

**Note:** not all criteria must be fulfilled to establish scientific causation, and the modern practice of EBM emphasizes 'experimental evidence' as superior to other criteria for experimental causation review. However many causation questions in health cannot be answered with experimental methods.

- visit <http://phprimer.afmc.ca> and refer to Table 5.4: Criteria for inferring a causal relationship from the AFMC Primer on Population Health

#### Beware:

##### Correlation ≠ Causation

e.g. There is evidence of a direct correlation between the amount of ice cream sold and the amount of deaths in swimming pools. Of course, ice cream does not cause drowning, rather, they both increase in the summer.

#### Criteria for Causation

##### ACCESS PTB

Analogy  
Consistency  
Coherence  
Experimental evidence  
Strength of association  
Specificity  
Plausibility  
Temporal relationship  
Biological gradient

#### Validity

- The degree to which the outcome observed in the study can be attributed to the intervention

#### 5 Questions About the Validity of Primary Studies

- Were the patients randomized?
- Was the follow-up of patients sufficiently long and complete?
- Were all patients analyzed in the groups to which they were randomized?
- Were the groups treated equally except for the intervention?
- Were the patients and clinicians kept blind to treatment?

#### Other Questions to Consider

- Were the groups similar (i.e. demographics, prognostic factors) at the start of the trial?
- Were the appropriate and valid exposure and outcome measures obtained?
- Were outcome assessors aware of group allocation?
- Was contamination reported?
- Were ethical issues continuously upheld?

#### Analysis

##### Per-Protocol Analysis (PP)

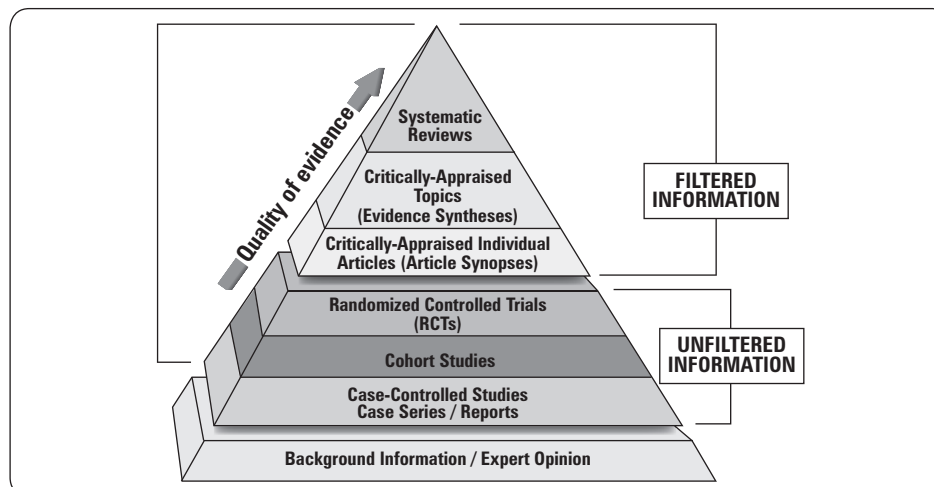

Strategy of analysis in which only patients who complete the entire study are counted towards the results.

##### Intention-to-Treat Analysis (ITT)

When groups are analyzed exactly as they existed upon randomization (i.e. using data from all patients, including those who did not complete the study).

## Assessing Evidence

- critical appraisal is the process of systematically examining research evidence to assess validity, results, and relevance before using it to inform a decision

**Figure 12. Pyramid of pre-appraised evidence**

© Copyright 2006. Trustees of Dartmouth College & Yale University. All rights reserved. Produced by Glover J., Izzo D., Odatto K. and Wang L.

### A. Are the results of the study valid?

- see below for classifications of evidence that has already been assessed; see sidebar for assessing primary studies

### B. What are the results?

- what was the impact of the treatment effect?
- how precise was the estimate of treatment effect?
- what were the confidence intervals and power of the study?

### C. Will the results help me in caring for my patients?

- are the results clinically significant?
- can I apply the results to my patient population?
- were all clinically important outcomes considered?
- are the likely treatment benefits worth the potential harm and costs?

#### Canadian Task Force on Preventive Health Care Grading of Health Promotion Actions

- A:** *Good evidence to recommend the preventive health measure*
- B:** *Fair evidence to recommend the preventive health measure*
- C:** *Existing evidence is conflicting and does not allow making a recommendation for or against use of the clinical preventive action, however other factors may influence decision-making*
- D:** *Fair evidence to recommend against the preventive health measure*
- E:** *Good evidence to recommend against the preventive health measure*
- I:** *Insufficient evidence (in quantity and/or quality) to make a recommendation, however other factors may influence decision-making*

Source: Canadian Task Force on Representative Health Care. Canadian task force on preventive new grades for recommendations. *CMAJ* 2003;169:207-208

#### Levels of Evidence: Classifications Cited in Guidelines/Consensus Statements

Level I evidence: based on RCTs (or meta-analysis of RCTs) big enough to have low risk of incorporating FP or FN results

Level II evidence: based on RCTs too small to provide Level I evidence; may show positive trends that are non-significant, or have a high risk of FN results

Level III evidence: based on non-randomized, controlled or cohort studies; case series; case-controlled; or cross-sectional studies

Level IV evidence: based on opinion of respected authorities or expert committees, as published consensus conferences/guidelines

Level V evidence: opinions of the individuals who have written/reviewed the guidelines (i.e. Level IV evidence), based on experience/knowledge of literature/peer discussion

Notes: These 5 levels of evidence are not direct evaluations of evidence quality or credibility; they reflect the nature of the evidence. While RCTs tend to be most credible (with <III), level III evidence gains credibility when multiple studies from different locations and/or time periods report consistent findings. Level IV and V evidence reflects decision-making that is necessary but in the absence of published evidence.

**Figure 13. Levels of evidence classifications**

Note: this is only one method of classifying evidence. Various systems exist, but operate within the same premise that certain types of evidence carry more weight than others

## Health Services Research

### Continuous Quality Improvement (CQI)

#### Quality Improvement

- method of evaluating and improving processes; focusing more on systems and systematic biases, which are thought to be the cause of variation in quality, as opposed to individuals
- taking measures to increase efficiency of action with the purpose of achieving optimal quality

#### Quality Assurance

- management system to assure the quality of health care provided by workers and received by patients
- constantly aims to improve standards and the frequency of attaining those standards
- **five-stage process of quality assurance**
  - establishment of functional goals
  - implementation of procedures to achieve those goals
  - regular assessment of performance relative to the goals
  - proposal of solutions to close the gap between performance and goals
  - documentation and reporting of this assessment activity

#### Quality Control

- method of maintaining standards by reviewing the quality of all factors involved in the process

#### Continuous Quality Improvement

- management approach to improve and maintain quality via continuous assessment of potential defects, followed by action to improve process, avoid decrease in quality or correcting process in early stages
- continuous feed-forward process

#### Quality Management

- encompasses quality assurance, quality control and quality improvement to achieve consistent quality

#### Total Quality Management

- management philosophy for improving quality while controlling costs
- focusing on the system rather than the individual, to ensure decisions are made to support quality and remove barriers to quality inherent in bureaucratic, hierarchical systems

#### Audit

- process of systematic examination of a quality system carried out by internal or external quality auditors
- to determine whether quality processes and results comply with goals, and whether processes have been implemented effectively

#### Systems Analyses Tools

1. **5 Whys:** brainstorming to simplify the process of change; continue asking 'why' until the root of the problem is discovered
2. **Ishikawa Diagrams (aka Fishbone Diagrams):** identify generic categories of problems that have an overall contribution on the effect (see Figure 13)

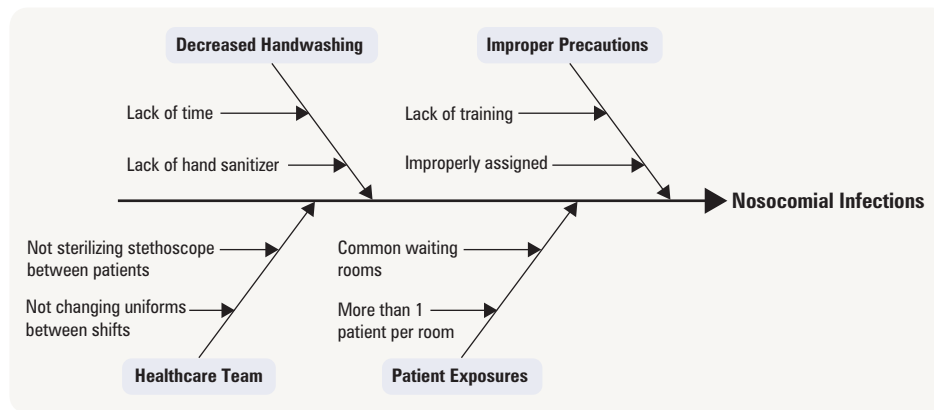

Figure 14. Ishikawa diagram

3. **Defect check sheets:** consider all defects and tally up the number of times the defect occurs

4. **Pareto Chart:** x vs. y chart; x-axis = defect categories, y-axis = frequency; plot cumulative frequency on the right y-axis

- purpose is to highlight most important among large set of factors contributing to defects/poor quality

### Precede-Proceed Model

- tool for designing, implementing, and evaluating health interventions/programs

Table 8. Precede-Proceed Model

PRECEDE Phase	PROCEED Phase
Phase 1 – Identify the ultimate desired result	Phase 5 – Implementation (design and conduct the intervention)
Phase 2 – Identify and set priorities among health issues and their behavioural and environmental determinants	Phase 6 – Process Evaluation (determine if the program is implemented as planned)
Phase 3 – Identify the predisposing, enabling, and reinforcing factors that affect the behaviours and environmental determinants	Phase 7 – Impact Evaluation (measure intermediate objectives – predisposing, enabling, and reinforcing factors)
Phase 4 – Identify the administrative and policy factors that influence what can be implemented	Phase 8 – Outcome Evaluation (measure desired result)

## Cost Analysis

### Cost Benefit Analysis

- a process of, either explicitly or implicitly, weighing the total expected costs against the total expected benefits of one or more actions in order to choose the best or most profitable option
- all costs are adjusted for the time value of money, so that costs that may change over time are expressed on a common basis in terms of their present value

### Cost Effectiveness Analysis (CEA)

- a comparison of the relative expenditure (costs) and outcomes (effects) of two or more courses of action
- cost effectiveness analysis is often used where a full cost benefit analysis is inappropriate
- a CEA is commonly expressed in terms of a ratio: the denominator is a gain in health from a measure (e.g. years of life, premature births averted, sight-years gained) and the numerator is the cost of the health gain
- the most commonly used outcome measure is quality-adjusted life years (QALY)

## Outbreak of Infectious Diseases

### Definitions

#### Outbreak

- occurrence of new cases clearly in excess of the baseline frequency of the disease in a defined community or population over a given period of time
- synonymous with epidemic, although generally considered to be an epidemic that is localized, has an acute onset, or is relatively short in duration

**Epidemic**

- any disease, infectious or chronic, occurring at a greater frequency than usually expected in a defined community or institutional population over a given time period (i.e. excessive rate of disease)

**Endemic**

- constant presence of disease or infectious agent in a given geographic area or population subgroup (i.e. usual rate of disease)

**Pandemic**

- epidemic over a wide area, crossing international boundaries, and affecting a large number of people

**Attack Rate**

- cumulative incidence of infection within a defined group observed during a specific period of time in an epidemic
- calculated by dividing the total number of people who develop clinical disease by the population at risk, usually expressed as a percentage

**Secondary Attack Rate**

- number of cases among contacts occurring within the incubation period following exposure to the primary case, in relation to the total exposed contacts
- infectiousness reflects the ease of disease transmission and is usually measured by the secondary attack rate

**Pathogenicity Rate**

- power of an organism to produce clinical disease in those that are affected

**Virulence**

- severity of the disease produced by the organism in a given host
- expressed as the ratio of the number of cases of severe and fatal infection to the total number of clinically affected

**Case-Fatality Rate**

- proportion of individuals contracting a disease who die as a result of that disease
- most frequently applied to a specific outbreak of acute disease in which all patients have been followed for an adequate period of time to include all attributable deaths
- must be clearly differentiated from the mortality rate

**Mortality Rate/Crude Death Rate**

- estimation of the portion of the population that dies during a specified period from all causes of death

**All-Cause Mortality Rate by Age Group**

- estimation of the portion of the population in a given age group that dies during a specified period from all causes of death for that age group

**Morbidity Rate**

- estimation of the portion of the population that suffers illness or ill health during a specified period

**Infection Control Precautions**  
(see [Infectious Diseases](#), ID6)**Contact** (impetigo, chicken pox, warts)

- Wash hands
- Gloves
- Gown
- Wipe equipment after use

**Airborne** (TB)

- Contact precautions PLUS
- N95 mask (fit tested)
- Negative pressure room

**Droplet** (influenza, mumps, pneumonia)

- Contact precautions PLUS
- Goggles/face shield
- Surgical mask

## Steps to Control an Outbreak

**1. Define the Problem**

- is it an outbreak?

**2. Appraise Existing Data and Institute a Surveillance System**

- case definition:** formulated from the most common symptoms or signs; definition includes the likely date of onset of illness of the first case (e.g. any person with onset of fever higher than 38.5°C and cough within past 28 d)
- active surveillance:** identify those who may have been exposed to the infectious agent and who fit the case definition through active efforts, including:

**3. Formulate Hypotheses and Implement Initial Control Measures**

- track outbreak evolution to develop hypotheses about potential source and populations at risk
- case management depends on symptoms, suspected agent, population at risk, and location
- population management requires public health services in the community and infection control teams in hospitals to disseminate information about
  - risk reduction
  - personal preventative measures (e.g. post-exposure prophylaxis)
  - decreasing risk of propagation (e.g. quarantine)

#### 4. Test the Hypothesis through Analysis of Surveillance Data or Special Studies

- analyze outbreak surveillance data
- generate epidemic curves
  - usually a frequency histogram, with the number of cases plotted on the vertical axis and dates or times of onset along the horizontal axis
  - curve can indicate whether the epidemic (outbreak) has a common source or whether it is propagated
  - **point source epidemic:** exposure is brief and essentially simultaneous (see Figure 15a)
  - extended source epidemic: exposure lasts for a period of days to weeks and may be continuous (no irregular peaks, see Figure 15b) or intermittent (irregularly spaced peaks)
  - **propagated epidemic:** begins with only a few exposed persons but is maintained by person-to-person transmission (e.g. measles/influenza); epidemic curve shows a series of peaks (see Figure 15c)
- use epidemic curves, cross-sectional studies, and/or case-control studies to evaluate hypotheses about cause of outbreak

#### 5. Draw Conclusions and Re-Adjust Hypothesis and Control Measures

- establish cause of outbreak with further epidemiologic investigation and revise initial control measures accordingly

#### 6. Plan for Long-Term Prevention and Control

- implement prevention measures to avoid similar future incidents
  - strengthen resistance of hosts (e.g. immunization)
  - interrupt modes of transmission in environment (e.g. improvements in food processing)
- communicate outbreak prevention and control strategies to the public

For specific examples, see "Communicable Diseases" section in: Shah CP. Public Health and Preventive Medicine in Canada. Toronto: Elsevier, 5th edition, 2003

Figure 15. Epidemic curves

Figure 15a. Point source epidemic curve

Figure 15b. Extended continuous source epidemic curve

Figure 15c. Propagated source epidemic curve

## Environmental Health

### Definition

- study of conditions in the natural and human-made environment that influence human health and well-being
- environmental exposures
  - four main reservoirs: air, food, water, and soil
  - three main routes: inhalation, ingestion, or absorption (skin)
  - usually divided into two main settings:
    - ♦ workplace (including schools): may see high level exposure in healthy individuals (see *Occupational Health*, PH23)
    - ♦ non-workplace: generally low level but chronic exposure; population at risk includes extremes of age, developing fetuses, and ill or immunocompromised individuals
- health impacts of the environment also include factors such as urban planning and how individuals interact with the built environment (e.g. safe pedestrian and bicycle paths are neighbourhood features that can facilitate more active lifestyles among residents)

## Environmental Health Jurisdiction

Table 9. Environmental Health Jurisdiction

<b>Public Health Unit</b>	Enforcement of water and food safety regulations (including restaurant food safety) Sanitation Assessment of local environmental risks Monitoring and follow-up of reportable diseases
<b>Municipal Government</b>	Waste disposal Recycling Water and sewage treatment/collection/distribution
<b>Provincial and Territorial Government</b>	Water and air quality standards Industrial emission regulation Toxic waste disposal
<b>Federal Government</b>	Designating and regulating toxic substances Regulating food products (e.g. Health Canada) Setting policy for pollutants that can travel across provincial boundaries
<b>International</b>	Multilateral agreements (e.g. Kyoto Protocol, UN Convention on Climate Change, International Joint Commission)

### Active Surveillance

Outreach such as visits or phone calls by the public health/surveillance authority to detect unreported cases (e.g. an infection control nurse goes to the ward and reviews temperature charts to see if any patient has a nosocomial infection).

### Passive Surveillance

A surveillance system where the public health/surveillance authority depends on others to submit standardized forms or other means of reporting cases (e.g. ward staff notify infection control when new cases of nosocomial infections are discovered).

## Risk Assessment

### Hazard Identification

- what is the hazard involved?
- assess potential hazards by taking an environmental health history

### Risk Characterization

- is the identified agent likely to elicit the patient's current symptoms?
- review known health impacts of the hazard and identify specific properties that contribute to or diminish adverse effects (e.g. some agents only become dangerous at threshold levels)

### Exposure Assessment

- is the patient's exposure to the environmental agent sufficient to have caused the current symptoms?
- quantify exposure through direct measurement or by reviewing frequency and nature of contact with hazard

#### Taking an Environmental Health History

CH<sub>2</sub>OPD<sub>2</sub>  
Community  
Home  
Hobbies  
Occupation  
Personal habits  
Diet  
Drugs

## Air

### Physical Contaminants

- sound waves
  - ionizing radiation
  - radon is naturally produced by soil containing uranium or radium, can contaminate indoor air and is associated with a small proportion of lung cancers
- ultraviolet radiation is increasing due to ozone layer destruction and increases risk of skin cancer
  - non-ionizing radiation
  - visible light, infrared, microwave

#### Effects of Ionizing Radiation

$\alpha$ -particles are larger and damage the skin and bronchial lining (airway irritation).

$\beta$ -particles are smaller and cause deeper damage (alveoli).

### Chemical Contaminants

- ground-level ozone
  - main component of smog with levels increasing in major cities
  - worsens asthma, irritates upper airway
- carbon monoxide (fossil fuel related, common byproduct of combustion)
  - aggravates cardiac disease at low levels
  - headache, nausea, dizziness at moderate levels
  - fatal at high levels
- sulphur dioxide (fossil fuel related), nitrogen oxides
  - contribute to acid rain
  - exacerbate breathing difficulties
- organic compounds (e.g. benzene, methylene chloride, tetrachloroethylene)
  - variety of health effects at high levels (e.g. benzene is a known carcinogen)
  - tend to be fat-soluble, easily absorbed through skin and difficult to excrete
- heavy metals (e.g. nickel, cadmium, chromium)
  - present in industrial emissions
  - variety of health effects: upper airway disease, asthma, decreased lung function
- second hand tobacco smoke
  - respiratory problems, increase risk of lung cancer

#### BPA, the Toxin Concern of 2009

Bisphenol A (BPA) is a chemical compound found in some hard, clear, lightweight plastics and resins. According to the NIH, animal studies suggest that ingested BPA may imitate estrogen and other hormones. In October 2008, Canada became the first country in the world to ban the import and sale of polycarbonate baby bottles containing BPA, stating that although exposure levels are below levels that cause negative effects, current safety margins need to be higher. The US FDA does not consider normal exposure to BPA to be a hazard, however the NIH has some concern that fetuses, infants, and children exposed to BPA may be at increased risk for early-onset puberty, prostate, and breast cancer.

### Biological Contaminants

- particulates
  - associated with decreased lung function, asthma, upper airway irritation
- moulds thrive in moist areas; 10-15% of the population allergic
- bacteria survive as spores and aerosols, can be distributed through ventilation systems (e.g. *Legionella*)
- dust mites (year-round) and pollens (seasonal) can trigger upper and lower-airway symptoms

### Climate Change

- anthropogenic greenhouse gas emissions (e.g. carbon dioxide, methane) leading to adverse changes in the global environment
  - increased extreme weather conditions (e.g. floods, hurricanes, heat waves)
  - increased distribution of disease vectors (e.g. mosquitoes and malaria)
  - increased malnutrition from crop failures
  - increased diarrheal diseases

## Water

### Biological Contaminants

- mostly due to human and animal waste
- Aboriginal Canadians, rural Canadians at higher risk
- bacteria: *Escherichia coli* (e.g. Walkerton, ON), *Salmonella*, *Pseudomonas*, *Shigella*
- protozoa: *Giardia*, *Cryptosporidium* (e.g. North Battleford, SK)

### Chemical/Industrial Contaminants

- chlorination by-products (e.g. chloroform can cause cancer at high levels)
- volatile organic compounds, heavy metals, pesticides, and other industrial waste products can be present in groundwater
- fluoride at high levels (greater than that of municipal fluoridation) can cause skeletal fluorosis

## Soil

- contamination sources: rupture of underground storage tanks, use of pesticides and herbicides, percolation of contaminated water runoffs, leaching of wastes from landfills, dust from smelting and coal burning power plants, direct discharge of industrial wastes, lead deposition, leakage of transformers
- most common chemicals: petroleum hydrocarbons, solvents, lead, pesticides, motor oil, other industrial waste products
- health effects:
  - infants and toddlers at highest risk of exposure due to hand-mouth behaviours
  - dependent on contaminant: leukemia, kidney damage, liver toxicity, neuromuscular blockade, developmental damage to the brain and nervous system, skin rash, eye irritation, headache, nausea, fatigue
- biological contamination: tetanus, *Pseudomonas*

## Food

Table 10. Comparison of Select Biological Contaminants of Food and Effects on Human Health

	Source	Effects
<i>Salmonella</i>	Raw eggs, poultry, meat	GI symptoms
<i>Campylobacter</i>	Raw poultry, raw milk	Joint pain, GI symptoms
<i>Escherichia coli</i>	Various including meat, sprouts Primarily undercooked hamburger meat	Watery or bloody diarrhea Hemolytic uremic syndrome (esp. children)
<i>Listeria monocytogenes</i>	Unpasteurized cheeses, prepared salads, cold cuts	Listeriosis: nausea, vomiting, fever, headache, rarely meningitis or encephalitis
<i>Clostridium botulinum</i>	Unpasteurized honey, canned foods	Dizziness, weakness, respiratory failure, GI symptoms: thirst, nausea, constipation
<b>Prion (BSE)</b>	Beef and beef products	Creutzfeldt-Jakob disease

BSE = bovine spongiform encephalopathy

- other biological food contaminants include:
  - viruses
  - mould toxins (e.g. aflatoxin → liver cancer)
  - parasites (e.g. *Toxoplasmosis*, tapeworm)
  - paralytic and shellfish poisoning (rare)
  - genetically modified organisms (GMO) – controversial with respect to health and environmental risk/benefits

### Chemical Contaminants

many persistent organic pollutants are fat-soluble and undergo bioamplification

- drugs (antibiotics, hormones)
- inadequately prepared herbal medications
- food additives and preservatives
  - nitrites highest in cured meats; can be converted to carcinogenic nitrosamines
  - sulphites commonly used as preservatives; associated with sulphite allergy (hives, nausea, shock)
- pesticide residues
  - older pesticides (e.g. DDT) have considerable human health effects
  - debate over risks of DDT vs. risks of malaria in malaria-endemic countries

### To Fluoridate or Not

At the recommended concentration of 0.8-1.0 mg/L, fluoride reduces cavities by 18-40%, and there is little risk of fluorosis unless other exposures (e.g. toothpaste, rinses, mouthwash, etc.) are swallowed. Opposition raises concerns that the intake is not easily controlled, and that children, and others may be more susceptible to health problems. However, public health experts strongly support fluoridation as an effective measure to prevent dental caries at the community level and reduce dental health inequities.

### The Walkerton Tragedy

In May 2000, the drinking water system in the town of Walkerton, ON, became contaminated with *Escherichia coli* O157:H7 and *Campylobacter jejuni*. Over 2,300 individuals became ill; 27 people developed hemolytic uremic syndrome and 7 individuals died in the outbreak.

Source: Ministry of the Attorney General. Report of the Walkerton inquiry. Ontario, 2002.

### Honey and Botulism

Although exceedingly rare, infant botulism has been documented as a form of food poisoning from *C. botulinum* found in honey. When an infant swallows spores of this bacterium, they grow and produce a toxin in the baby's intestine. By the time an infant is 1, its gut has a healthy colony of "good" bacteria that prevents this from occurring.

### Organic Foods

- Foods designated as "organic" in Canada must conform to the Organic Products Regulations enforced by the Canadian Food Inspection Agency
- Organic foods are not free of synthetic pesticide residues but typically contain smaller amounts compared to conventionally grown foods
- Currently, there has not been strong evidence to suggest that eating organic foods is safer or more nutritious compared to eating conventionally grown food

Source: Health Canada. Pesticides and food, 2011. UpToDate. Organic foods and children, 2009.

- polychlorinated biphenyls (PCBs)
  - effects (severe acne, numbness, muscle spasm, bronchitis) much more likely to be seen in occupationally exposed individuals than in the general population
- dioxins and furans
  - levels highest in fish and marine mammals, also present in breast milk
  - can cause immunosuppression, liver disease, respiratory disease

## Heavy Metal Toxicity

### Mechanism

- after exposure, superabundant metals bind to proteins, alter their enzymatic activity, and lead to diffuse disease manifestations

### Predisposing Factors in At-Risk Groups

- children: hand-to-mouth, incomplete blood brain barrier
- pregnant women and developing fetus: heavy metals cross placenta; mothers release heavy metal stores at times of calcium stress
- adults: occupation, hobbies, environment (home, country)

### Etiology

- iatrogenic (e.g. gold treatment for rheumatoid arthritis, lithium treatment for bipolar affective disorder)
- inhalation (e.g. zinc oxide, lead gasoline fumes)
- ingestion (e.g. lead paint, mercury in fish, folk remedies)
- industry (e.g. methyl mercury industrial spill caused Minamata disease)

### Treatment

- generalized workup: symptoms are usually wide-ranging and non-specific
- chelation therapy (e.g. dimercaprol)

## Occupational Health

- occupational health is the maintenance and promotion of health in the work environment
- occupational health services include physicians, nurses, engineers, ergonomists, safety officers, physicists, technicians and others
- services encompass health promotion and protection (primary prevention), disease prevention (secondary prevention), and treatment and rehabilitation (tertiary prevention)
- general bias towards reporting occupational injuries versus occupational disease, as occupational disease is harder to identify

#### Occupational Health Statistics

- 939 workplace fatalities and 260,284 lost-time injuries in Canada in 2009
- 5703 fatal work injuries in the United States in 2006; rate = 3.9/100,000 workers

## Workplace Health Promotion and Protection

- take action in the workplace so the worker is protected from injury or illness
  - identifying workplace hazards [e.g. through material safety data sheets (MSDS)]
  - assessing risk
  - reducing exposure
    - ♦ **source:** substituting a less toxic chemical
    - ♦ **path:** enclosing a source of noise in a sound-proof room
    - ♦ **worker:** personal protection equipment (e.g. reflective vests, helmets)
    - ♦ **worker education:** emergency protocols, material safety education
    - ♦ **rotation of workers:** decrease exposure for each worker but more workers exposed

#### Reducing Exposure in the Workplace

- Engineering controls – most preferred
- Administrative/work practices
- Personal protective equipment – least preferred due to adherence challenges

## Workplace Disease Prevention

- monitor workers' health to prevent the development of disease
  - periodic examinations to facilitate pre-symptomatic diagnosis (e.g. screening for lead exposure); substance misuse screening where performance impairment is suspected

## Workplace Treatment and Rehabilitation

- treat injury or illness with safe return to the workplace
- may require rehabilitation, retraining, change in job duties, and/or workers' compensation

### Ontario's *Workplace Safety and Insurance Act* (Each province will have their own similar legislation)

- Establishes Workplace Safety and Insurance Board (WSIB), an autonomous government agency that oversees workplace safety training and administers insurance for workers and employers
- WSIB decides benefits for workers, which may include reimbursement for
  - Loss of earned income
  - Non-economic loss (e.g. physical, functional, or psychological loss extending beyond the workplace)
  - Loss of retirement income
  - Health care expenses (e.g. first-aid, medical treatment)
  - Survivor benefits (e.g. dependents and spouses can receive benefits)
- Employers pay for costs (e.g. no government funding)
- No-fault insurance (e.g. worker has no right to sue the employer) in return for guaranteed compensation for accepted claims
- Negligence is not considered a factor
- Physicians are required to provide the WSIB with information about a worker's health without a medical waiver once a claim is made

For more info: <http://www.wsib.on.ca/en/community/WSIB>

### Taking an Occupational Health Hx:

#### WHACS

**W**hat do you do?

**H**ow do you do it?

**A**re you concerned about any particular exposures on or off the job?

**C**o-workers or others with similar problems?

**S**atisfied with your job?

*J Occup Environ Med 1998; 40:680-4*

## Workplace Legislation

- universal across Canada for corporate responsibility in the workplace: due diligence, application of Workplace Hazardous Materials Information System (WHMIS), existence of joint health and safety committees in the workplace with representatives from workers and management
- jurisdiction in Canada is provincial (90% of Canadian workers), except for 16 federally regulated industries (e.g. airports, banks, highway transport) under the *Canada Labour Code*
- Ontario's *Occupational Health and Safety Act*
  - sets out rights of workers and duties of employers, procedures for dealing with workplace hazards, and law enforcement
  - workers have the right to
    - ♦ participate (e.g. have representatives on joint health and safety committees)
    - ♦ know (e.g. be trained and have information about workplace hazards)
    - ♦ refuse work (e.g. workers can decline tasks they feel are overly dangerous)
    - ♦ stop work (e.g. 'certified' workers can halt work they feel is dangerous to other workers)
  - employers must take precautions to protect the health and safety of employees and investigate concerns
  - enforced by Ministry of Labour via inspectors
- *Health Protection and Promotion Act* (HPPA) (Ontario)
  - Medical Officer of Health has right to investigate and manage health hazards where workplace exposures may impact non-workers (e.g. community members living close to the work site)

## Taking an Occupational Health History

- current and previous job duties
- exposures
  - identification: screen for chemical, metal, dust, biologic, psychologic and physical hazards; review relevant workplace material safety data sheets (MSDS)
  - assessment: duration, concentration, route, exposure controls (e.g. ventilation, personal protective equipment)
- temporal relationship: changes in symptoms in relationship to work environment
- presence of similar symptoms in co-workers
- non-work exposures: home, neighbourhood, hobbies

## Occupational Hazards

**Table 11. Occupational Hazards**

Physical	Chemical	Biological	Psychosocial
<ul style="list-style-type: none"> <li>• Trauma (fractures, lacerations)</li> <li>• Noise (hearing loss)</li> <li>• Temperature (heat cramps, heat exhaustion, heat stroke)</li> <li>• Air pressure (barotrauma, decompression sickness)</li> <li>• Ergonomic               <ul style="list-style-type: none"> <li>• Repetitive use/overuse injuries, excessive force, awkward postures, poorly designed physical work environment</li> <li>• Tenosynovitis, bursitis, carpal tunnel syndrome</li> </ul> </li> <li>• Radiation               <ul style="list-style-type: none"> <li>• Non-ionizing: visible light, infrared</li> <li>• Ionizing: UV, x-rays, γ rays</li> </ul> </li> <li>• Electricity</li> </ul>	<ul style="list-style-type: none"> <li>• Organic solvents (e.g. benzene, methyl alcohol; most toxic is carbon tetrachloride)</li> <li>• Mineral dusts (e.g. silica leads to silicosis and predisposition to TB, asbestos leads to diffuse fibrosis and mesothelioma, coal leads to pneumoconiosis)</li> <li>• Heavy metals (e.g. nickel, cadmium, mercury, lead)               <ul style="list-style-type: none"> <li>• Lead is ubiquitous and can cause severe disability</li> </ul> </li> <li>• Gases (e.g. halogen gases, sulphur dioxide, carbon monoxide, nitrogen oxides)</li> <li>• Second hand smoke (causal factor for lung cancer, lung disease, heart disease, asthma exacerbations; may be linked to miscarriage)               <ul style="list-style-type: none"> <li>• Exposure restricted in most municipal, provincial, and federal jurisdictions</li> </ul> </li> <li>• Skin diseases (major portion of compensations, e.g. contact dermatitis, occupational acne, pigmentation disorders)</li> </ul>	<ul style="list-style-type: none"> <li>• Exposure to bacteria, viruses, fungi, protozoa, Rickettsia</li> <li>• Blood should be considered a potentially toxic substance due to blood-borne infectious diseases (e.g. HIV, hepatitis B)</li> <li>• Consider exposure to disease in endemic countries, travelers from endemic countries, or recent travel history in the setting of acute onset of symptoms (e.g. SARS, TB)</li> </ul>	<ul style="list-style-type: none"> <li>• Workload, responsibility, fear of job loss, geographical isolation, shift work, harassment (sexual/non-sexual)</li> <li>• Incurs high cost from absenteeism, poor productivity, mental illness (e.g. post-traumatic stress disorder)</li> </ul>

## Appendix – Reportable Diseases

As an essential part of the health system, physicians in Canada are required by law to report certain diseases to public health for the following reasons:

1. to control the outbreak
  - if the disease presents an outbreak threat (e.g. measles, *Salmonella*, respiratory diseases in institutions)
2. to prevent spread
  - if the disease presents a significant threat to individuals or a subset of the population (e.g. Lassa Fever)
3. for surveillance
  - if the disease is preventable with immunization (e.g. polio, diphtheria, congenital rubella)
4. if infected individuals require education, treatment and/or partner notification (e.g. gonorrhea, TB)

Physicians should also report unlisted diseases that appear in clusters.

The following list is based on the reportable diseases in Ontario for 2011.  
(Each province will have their own similar legislation)

Source: Health Protection and Promotion Act, O. Reg. 559/91, amended to O. Reg.49/07.

Acquired Immunodeficiency Syndrome (AIDS)	<i>Haemophilus influenzae b</i> disease, invasive	Rabies
Amebiasis	Hantavirus pulmonary syndrome	Respiratory infection outbreaks in institutions
Anthrax	Hemorrhagic fevers, including:	Rubella
	i. Ebola virus disease	Rubella, congenital syndrome
Botulism	ii. Marburg virus disease	
Brucellosis	iii. Other viral causes	
	Hepatitis, viral:	Salmonellosis
Campylobacter enteritis	i. Hepatitis A	Severe Acute Respiratory Syndrome (SARS)
Chancroid	ii. Hepatitis B	Shigellosis
Chickenpox (Varicella)	iii. Hepatitis C	Smallpox
<i>Chlamydia trachomatis</i> infections	iv. Hepatitis D (Delta hepatitis)	Streptococcal infections, Group A invasive
Cholera	Herpes, neonatal	Streptococcal infections, Group B neonatal
<i>Clostridium difficile</i> associated disease (CDAD) outbreaks in public hospitals	Human Immunodeficiency Virus (HIV)	<i>Streptococcus pneumoniae</i> , invasive
Cryptosporidiosis	Influenza	syphilis
Cyclosporiasis		
Cytomegalovirus infection, congenital	Lassa Fever	
	Legionellosis	Tetanus
Diphtheria	Leprosy	Transmissible spongiform encephalopathy, including:
	Listeriosis	i. Creutzfeldt-Jakob disease, all types
Encephalitis, including:	Lyme Disease	ii. Gerstmann-Sträussler-Scheinker syndrome
i. Primary, viral		iii. Fatal familial insomnia
ii. Post-infectious	Malaria	iv. Kuru
iii. Vaccine-related	Measles	Trichinosis
iv. Subacute sclerosing panencephalitis	Meningitis, acute:	Tuberculosis
v. Unspecified	i. Bacterial	Tularemia
	ii. Viral	Typhoid Fever
Food poisoning, all causes	iii. Other	
	Meningococcal disease, invasive	
Gastroenteritis, institutional outbreaks	Mumps	
Giardiasis, except asymptomatic cases		Verotoxin-producing <i>E. coli</i> infection
Gonorrhea	Ophthalmia neonatorum	indicator conditions, including Hemolytic Uremic Syndrome (HUS)
	Paratyphoid fever	
	Pertussis (whooping cough)	West Nile Virus illness, including:
	Plague	i. West Nile fever
	Poliomyelitis, acute	ii. West Nile neurological manifestations
	Psittacosis/Ornithosis	
	Q Fever	Yellow Fever
		Yersiniosis

## Acronyms

5-HT	serotonin	CD	conduct disorder	IPT	interpersonal therapy	ODD	oppositional defiant disorder
ACT	assertive community treatment	CT	cognitive therapy	MAOI	monoamine oxidase inhibitor	PD	personality disorder
ACh	acetylcholine	DA	dopamine	MDD	major depressive disorder	PDD	pervasive developmental disorder
ADHD	attention deficit hyperactivity disorder	ECT	electroconvulsive therapy	MDE	major depressive episode	PTSD	post-traumatic stress disorder
AN	anorexia nervosa	EPS	extrapyramidal symptoms	MSE	mental status examination	SNRI	serotonin and norepinephrine reuptake inhibitors
ASPD	antisocial personality disorder	EtOH	ethanol/alcohol	NOS	not otherwise specified	SSRI	selective serotonin reuptake inhibitor
BN	bulimia nervosa	GAD	generalized anxiety disorder	OCD	obsessive-compulsive disorder	TCA	tricyclic antidepressant
CBT	cognitive behavioural therapy	GMC	general medical condition	OCPD	obsessive-compulsive personality disorder		

**N.B. The content in this chapter does not reflect the changes made to diagnostic criteria in the DSM-V**

## Psychiatric Assessment

### History

#### Identifying Data

- name, sex, age, ethnicity, marital status, religion, occupation, education, type of residence, with whom they are living, referral source

#### Reliability of Patient as a Historian

- may need collateral source (e.g. parent, teacher) if patient unable/unwilling to co-operate

#### Chief Complaint

- in patient's own words, duration

#### History of Present Illness

- reason for seeking help (that day), current symptoms (onset, duration and course), stressors, supports, functional status, relevant associated symptoms (pertinent positives and negatives)
- safety screen: is the patient endangering self or others? dependents at home (e.g. children, pets), ability to drive safely, ability to care for self (e.g. eating, hygiene, taking medications)

#### Psychiatric Functional Inquiry

- mood: depressed, manic
- anxiety: worries, obsessions, compulsions, panic attacks, phobias, history of trauma
- psychosis: hallucinations, delusions, thought form disorders
- suicide/homicide: ideation, plan, intent, history of attempts
- organic: EtOH/drug use or withdrawal, illness, dementia

#### Past Psychiatric History

- all previous psychiatric diagnoses, psychiatric contacts, treatments (pharmacological and non-pharmacological) and hospitalizations
- also include past suicide attempts, substance use/abuse, and legal problems

#### Past Medical/Surgical History

- all medical, surgical, neurological (e.g. head trauma, seizures), and psychosomatic illnesses
- medications, allergies

#### Family Psychiatric/Medical History

- family members: ages, occupations, personalities, medical or genetic illnesses and treatments, relationships with parents/siblings
- family psychiatric history: any past or current psychiatric illnesses and hospitalizations, suicide, substance abuse

#### Past Personal History

- prenatal and perinatal history (desired vs. unwanted pregnancy, maternal and fetal health, domestic violence, maternal substance use, complications of pregnancy/delivery)
- early childhood to age 3 (developmental milestones, activity/attention level, family stability, attachment figures)
- middle childhood to age 11 (school performance, peer relationships, fire-setting, stealing, incontinence)
- late childhood to adolescence (drug/alcohol, legal problems, peer and family relationships)
- physical or sexual abuse in childhood/adolescence
- adulthood (education, occupations, relationships)
- psychosexual history (paraphilias, gender roles, sexual abuse, sexual dysfunction)
- personality before current illness, recent changes in personality

#### Screening Questions for Major Psychiatric Disorders

- Have you been feeling down, depressed or hopeless?
- Do you feel anxious or worry about things?
- Has there been a time in your life where you have felt euphoric, extremely talkative, had a lot of energy, and a decreased need for sleep?
- Do you see or hear things that you think other people cannot?
- Have you ever thought of harming yourself or committing suicide?

#### Psychiatric Functional Inquiry

##### MOAPS

##### Mood

Organic (e.g. substances and organic disease)

##### Anxiety

##### Psychosis

##### Safety

**Always Remember to Ask About Abuse**  
See [Family Medicine](#), FM28.

## Mental Status Exam (MSE)

### General Appearance and Behaviour

- dress, grooming, posture, gait, physical characteristics, body habitus, apparent vs. chronological age, facial expression (e.g. sad, suspicious)
- psychomotor activity (agitation, retardation), abnormal movements or lack thereof (tremors, akathisia, tardive dyskinesia, paralysis), attention level and eye contact, attitude toward examiner (ability to interact, level of co-operation)

### Speech

- rate (e.g. pressured, slowed), rhythm/fluency, volume, tone, articulation, quantity, spontaneity

### Mood and Affect

- mood: subjective emotional state (in patient's own words)
- affect: objective emotional state inferred from emotional responses to stimuli. Described in terms of:
  - quality (euthymic, depressed, elevated, anxious)
  - range (full, restricted, flat, blunted)
  - stability (fixed, labile)
  - mood congruence (inferred by reader by comparing mood and affect descriptions)
  - appropriateness to thought content

### Thought Process

- coherence (coherent, incoherent)
- logic (logical, illogical)
- stream
  - goal-directed
  - circumstantial: speech that is indirect and delayed in reaching its goal; eventually comes back to the point
  - tangential: speech is oblique or irrelevant; does not come back to the original point
  - loosening of associations: illogical shifting between topics
  - flight of ideas: quickly skipping from one idea to another where the ideas are marginally connected, associated with mania
  - word salad: jumble of words lacking meaning or logical coherence
- perseveration: repetition of the same verbal or motor response to stimuli
- echolalia: repetition of phrases or words spoken by someone else
- thought blocking: sudden cessation of flow of thought and speech
- clang associations: speech based on sound such as rhyming or punning
- neologism: use of novel words or of existing words in a novel fashion

### Thought Content

- suicidal ideation/homicidal ideation
  - frequency and pervasiveness of thoughts, formulation of plan, means to plan, intent, active vs. passive, protective factors
- pre-occupations, ruminations: reflections/thoughts at length, not fixed or false
- obsession: recurrent and persistent thought, impulse or image which is intrusive or inappropriate
  - cannot be stopped by logic or reason
  - causes marked anxiety and distress
  - common themes: contamination, orderliness, sexual, pathological doubt/worry/guilt
- magical thinking: belief that thinking something will make it happen; normal in children
- ideas of reference: similar to delusion (fixed false belief), but the reality of the belief is questioned
- overvalued ideas: unusual/odd beliefs that are not of delusional proportions
- first rank symptoms of schizophrenia: thought insertion/withdrawal/broadcasting
- delusion: a fixed false belief that is out of keeping with a person's cultural or religious background and is firmly held despite incontrovertible proof to the contrary

### Perception

- hallucination: sensory perception in the absence of external stimuli that is similar in quality to a true perception
  - auditory (most common), visual, gustatory, olfactory, tactile
- illusion: misperception of a real external stimulus
- depersonalization: change in self-awareness such that the person feels unreal, detached from his or her body, and/or unable to feel emotion
- derealization: feeling that the world/outer environment is unreal

#### Mental Status Exam

##### ASEPTIC

Appearance and behaviour  
Speech  
Emotion (mood and affect)  
Perception  
Thought content and process  
Insight and judgment  
Cognition

The MSE is analogous to the physical exam. It focuses on current signs, affect, behaviour and cognition.

#### Spectrum of Affect

Full > Restricted > Blunted > Flat

There is poor correlation between clinical impression of suicide risk and frequency of attempts.

#### Delusions

- Persecutory: belief that others are trying to cause harm to you
- Reference: interpreting publicly known events/celebrities as having direct reference to you
- Erotomania: belief that another is in love with you
- Grandiose: an inflated sense of self-worth or power
- Religious: belief of receiving instructions/powers from a higher being; of being a higher being
- Somatic: belief that you have a physical disorder/defect
- Nihilistic: belief that things do not exist; a sense that everything is unreal

#### Cognitive Assessment

Use MMSE to assess:

- Orientation (time and place)
- Memory (immediate and delayed recall)
- Attention and concentration
- Language (comprehension, reading, writing, repetition, naming)
- Spatial ability (intersecting pentagons)

Gross screen for cognitive dysfunction:  
Total score is out of 30; <24 abnormal, 20-24 mild, 10-19 moderate, <10 severe

## Cognition

- level of consciousness
- orientation: time, place, person
- memory: immediate, recent, remote
- global evaluation of intellect (below average, average, above average)
- intellectual functions: attention, concentration, calculation, abstraction (proverb interpretation, similarities test), language, communication

## Insight

- patient's ability to realize that he or she has a physical or mental illness and to understand its implications

## Judgement

- patient's ability to understand relationships between facts and draw conclusions that determine one's actions

### Assessing Insight and Judgement

#### Insight

- Do you think that you have a mental illness?
- Why are you taking this medication?
- Why are you in the hospital?

#### Judgement

Can be observed from collected history and patient's appearance and actions.

- Is he/she dressed appropriately for the weather?
- Is he/she acting appropriately in the given situation?
- Is he/she taking care of self and/or dependents?

### Axis V: Global Assessment of Functioning

The description of each 10-point range in the GAF scale has two components: the first part covers symptom severity, and the second part covers functioning. It should be noted that in situations where the individual's symptom severity and functioning are discordant, the final GAF rating always reflects the worse of the two.

91-100	Superior functioning in a wide range of activities
81-90	Absent or minimal symptoms
71-80	If symptoms are present, they are transient and expected reactions to psychosocial stressors
61-70	Some mild symptoms or some difficulty but generally functioning well
51-60	Moderate symptoms or difficulty
41-50	Serious symptoms or difficulty
31-40	Some impairment in reality testing/communication, impairment in several areas
21-30	Behaviour is influenced by delusions/hallucinations or serious impairment in communication/judgment
11-20	Some danger of hurting self or others or occasionally fails to maintain minimal hygiene or gross impairment in communication
1-10	Persistent danger of severely hurting self or others or persistent inability to maintain minimal personal hygiene or serious suicidal act
0	Inadequate information

### Suicide Risk Factors

#### SAD PERSONS

**Sex** (male)

**Age** >60 yr old

**Depression**

**Previous attempts**

**Ethanol abuse**

**Rational thinking loss** (delusions, hallucinations, hopelessness)

**Suicide in family**

**Organized plan**

**No spouse** (no support systems)

**Serious illness, intractable pain**

## Summary of Axes

### Multiaxial Assessment

- **Axis I**
  - differential diagnosis of DSM-IV clinical disorders
- **Axis II**
  - personality disorders, developmental disability
- **Axis III**
  - general medical conditions that are potentially relevant to the understanding or management of the mental disorder
- **Axis IV**
  - psychosocial and environmental issues
- **Axis V**
  - Global Assessment of Functioning (GAF, 0 to 100) incorporating effects of axes I to IV

### Formulation

- summary outlining current issues and interrelations between an individual's biological, psychological, and social factors
- for each category: predisposing, precipitating, perpetuating, and protecting factors

### Approach to Management

- biological (e.g. pharmacotherapy), psychological [e.g. cognitive behavioural therapy (CBT)], social (e.g. support group)

## Suicide

### Epidemiology

- attempted:completed = 20:1
- M:F = 1:4 for attempts, 3:1 for completed

### Risk Factors

- epidemiologic factors
  - age: increases after age 14, second most common cause of death for ages 15-24, highest rates in persons >65 yr
  - sex: male
  - race/ethnic background: white or native Canadians on reserves
  - marital status: widowed/divorced
  - living situation: alone; no children <18 yr old in the household
  - other: stressful life events, access to firearms
- psychiatric disorders
  - mood disorders (15% lifetime risk in depression; higher in bipolar)
  - anxiety disorders (especially panic disorder)
  - schizophrenia (10-15% risk)
  - substance abuse (especially alcohol – 15% lifetime risk)
  - eating disorders (5% lifetime risk)
  - adjustment disorder
  - conduct disorder
  - personality disorders (borderline, antisocial)
- past history
  - prior suicide attempt
  - family history of suicide attempt/completion

## Clinical Presentation

- symptoms associated with suicide:
  - hopelessness
  - anhedonia
  - insomnia
  - severe anxiety
  - impaired concentration
  - psychomotor agitation
  - panic attacks

## Approach

### Every Patient: "Have you had any thoughts of wanting to hurt or kill yourself?"

- passive ideation: would rather not be alive but has no active plan for suicide
  - ♦ e.g. "I'd rather not wake up" or "I would not mind if a car hit me"
- active ideation
  - ♦ e.g. "I think about killing myself"
- plan: "Do you have a plan as to how you would end your life?"
- intent: "You talk about wanting to die, but are you planning to do this?" or "What has stopped you from ending your life?"
- past attempts: highest risk if previous attempt in past year
  - ♦ ask about lethality, outcome, medical intervention

## Assessment of Suicidal Ideation

- onset and frequency of thoughts: "When did this start?" or "How often do you have these thoughts?"
- control over suicidal ideation: "Can you stop the thoughts or call someone for help?"
- lethality: "Do you want to end your life?" or "What do you think would happen if you actually took those pills?"
- access to means: "How will you get a gun?" or "Which bridge do you think you would go to?"
- time and place: "Have you picked a date and place? Is it in an isolated location?"
- provocative factors: "What makes you feel worse (e.g. being alone)?"
- protective factors: "What keeps you alive (e.g. friends, family, pets, faith, therapist)?"
- final arrangements: "Have you written a suicide note? Made a will? Given away your belongings?"
- practiced suicide or aborted attempts: "Have you put the gun to your head?" "Held the medications in your hand?" "Stood at the bridge?"
- ambivalence: "There must be a part of you that wants to live, after all you came here for help"

## Assessment of Suicide Attempt

- setting (isolated vs. others present, chance of discovery)
- planned vs. impulsive attempt, triggers/stressors
- intoxication
- medical attention (brought in by another person vs. brought in by self to ER)
- time lag from suicide attempt to ER arrival
- expectation of lethality, dying
- reaction to survival (guilt/remorse vs. disappointment/self-blame)

## Management

- proper documentation of the clinical encounter and rationale for management is essential
- higher risk (hospitalization needs to be strongly considered)
  - patients with a plan, access to lethal means, recent social stressors, and symptoms suggestive of a psychiatric disorder
  - do not leave patient alone; remove potentially dangerous objects from room
  - if patient refuses to be hospitalized, complete form for involuntary admission (Form 1)
- lower risk
  - patients who are not actively suicidal, with no plan or access to lethal means
  - discuss protective factors and supports in their life, remind them of what they live for, promote survival skills that helped them through previous suicide attempts
  - make a safety plan: an agreement that they will:
    - ♦ not harm themselves
    - ♦ avoid alcohol, drugs, and situations that may trigger suicidal thoughts
    - ♦ follow-up with you at a designated time
    - ♦ contact a health care worker, call a crisis line or go to an emergency department if they feel unsafe or if their suicidal feelings return or intensify
- depression: consider hospitalization if symptoms severe or if psychotic features are present; otherwise outpatient treatment with good supports and SSRIs/SNRIs
- alcohol-related: usually resolves with abstinence for a few days; if not, suspect depression
- personality disorders: crisis intervention/confrontation, may or may not hospitalize
- schizophrenia/psychosis: hospitalization might be necessary
- parasuicide/self-mutilation: long-term psychotherapy with brief crisis intervention when necessary

### Pharmacotherapy and Suicide Risk

Once antidepressant therapy is initiated, patients should be followed frequently as there is a "suicide window" in which the patient may still be depressed, but now has enough energy to carry out suicide. Avoid tricyclic antidepressants (TCAs) because of high lethality in overdose!

### Suicidal Ideation Assessment

- Asking patients about suicide will not give them the idea or the incentive to commit suicide
- The best predictor of completed suicide is a history of attempted suicide
- The most common psychiatric disorders associated with completed suicide are mood disorders and alcohol abuse

# Psychotic Disorders

## Definition

- characterized by a significant impairment in reality testing
  - delusions or hallucinations (with/without insight into their pathological nature)
  - behaviour so disorganized that it is reasonable to infer that reality testing is disturbed

**Table 1. Differentiating Psychotic Disorders**

Disorder	Psychotic Symptoms	Duration
Brief psychotic disorder	≥1 positive symptoms of criterion A	<1 mo
Schizophreniform disorder	Criterion A	1-6 mo
Schizophrenia	Criterion A	>6 mo
Schizoaffective disorder	≥2 wk (with no mood symptoms)	>1 mo
Delusional disorder	Non-bizarre delusions, hallucinations	>1 mo
2° to substance intoxication/withdrawal	Criterion A	During intoxication or ≤1 mo after withdrawal
2° to mood disorder	Delusions/hallucinations (mood congruent)	Unspecified

### Duration of Time Differentiates the following 3 Psychotic Disorders

Brief Psychotic Disorder <1 month	Schizophreniform Disorder 1-6 months	Schizophrenia >6 months
		→

**Figure 1. Differentiating psychotic disorders with duration**

## Differential Diagnosis of Psychosis

- primary psychotic disorders: schizophrenia, schizophreniform, brief psychotic, schizoaffective, shared psychotic, delusional disorder
- mood disorders: depression with psychotic features, bipolar disorder (mania or depression with psychotic features)
- personality disorders: schizotypal, schizoid, borderline, paranoid, obsessive-compulsive
- general medical conditions: tumour, head trauma, dementia, delirium, metabolic, infection, stroke, temporal lobe epilepsy
- substance-induced psychosis: intoxication or withdrawal, prescribed medications, toxins

### Differential Diagnosis of Psychosis

#### GASPP

General medical condition  
Affective disorders  
Substance induced  
Psychotic disorders  
Personality disorders

### Management of Acute Psychosis and Mania

- Ensure safety of self, patient and other patients
- Have an exit strategy
- Decrease stimulation
- Assume a non-threatening stance
- IM medications (benzodiazepine + antipsychotic) often needed as patient may refuse oral medication
- Physical restraints may be necessary
- Do not use antidepressants or stimulants

### Suggested Criteria for Prodromal Syndromes

- Attenuated positive symptom syndrome: Abnormal/unusual thought content, suspiciousness, grandiosity, perceptual abnormalities, and/or organization of communication; onset or worsening in past year
- Brief intermittent psychotic syndrome: Frankly psychotic, unusual thought content, suspiciousness, grandiosity, perceptual abnormalities, and/or organization of communication; onset in past 3 mo
- Genetic risk plus functional deterioration: First-degree relative with history of any psychotic disorder or schizotypal personality disorder in patient; substantial functional decline in past year

Adapted from Sadock BJ and Sadock VA. *Kaplan and Sadock's Comprehensive Textbook of Psychiatry*, 8th Ed. Philadelphia: Lippincott Williams & Wilkins, 2005.

## Schizophrenia

### DSM-IV-TR Diagnostic Criteria for Schizophrenia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- characteristic symptoms (active phase): ≥2 of the following, each present for a significant portion of time during a 1-mo period (or less if successfully treated)
  - delusions
  - hallucinations
  - disorganized speech (e.g. frequent derailment or incoherence)
  - grossly disorganized or catatonic behaviour
  - negative symptoms [e.g. affective flattening, alogia (inability to speak), or avolition (inability to initiate and persist in goal-directed activities)]
- only 1 "A" symptom is required if delusions are bizarre or hallucinations consist of a voice keeping a running commentary on the person's behaviour or thoughts, or 2 or more voices conversing with each other
- social/occupational dysfunction: ≥1 major areas of functioning (work, interpersonal relations, self-care) markedly below the level achieved prior to the onset of symptoms
- continuous signs of disturbance for ≥6 mo, including ≥1 mo of active phase symptoms; may include prodromal or residual phases
- schizoaffective and mood disorders excluded
- the disturbance is not due to the direct physiological effects of a substance or a GMC
- if history of pervasive developmental disorder, additional diagnosis of schizophrenia is made only if prominent delusions or hallucinations are also present for at least 1 mo

### Subtypes

- paranoid
  - preoccupation with delusions (typically persecutory or grandiose) or frequent auditory hallucinations
  - relative preservation of cognitive functioning and affect; onset tends to be later in life; believed to have the best prognosis

- catatonic
  - at least two of: motor immobility (catalepsy or stupor); excessive motor activity (purposeless); extreme negativism (resistance to instructions/attempts to be moved) or mutism; peculiar voluntary movement (posturing, stereotyped movements, prominent mannerisms); echolalia or echopraxia (copying another's speech or movement)
- disorganized
  - disorganized speech and behaviour; flat or inappropriate affect
  - poor premorbid personality, early and insidious onset, and continuous course without significant remissions
- undifferentiated
  - meets criteria for schizophrenia, but does not fall into the 3 previous subtypes
- residual
  - no longer have prominent delusions, hallucinations, disorganized speech, grossly disorganized or catatonic behaviour
  - continuing evidence of residual illness such as negative symptoms or attenuated symptoms of criteria A

### Epidemiology

- prevalence: 0.5%-1%; M:F = 1:1
- mean age of onset: females ~27; males ~21

### Etiology

- multifactorial: disorder is a result of interaction between both biological and environmental factors
  - genetic: 40% concordance in monozygotic (MZ) twins; 46% if both parents have schizophrenia; 10% of dizygotic (DZ) twins, siblings, children affected
  - neurochemistry ("dopamine hypothesis" theory): excess activity in the mesolimbic dopamine pathway may mediate the positive symptoms of psychosis while decreased dopamine in the prefrontal cortex may mediate negative and cognitive symptoms. GABA, glutamate and ACh dysfunction are also thought to be involved
  - neuroanatomy: decreased frontal lobe function; asymmetric temporal/limbic function; decreased basal ganglia function; subtle changes in thalamus, cortex, corpus callosum, and ventricles; cytoarchitectural abnormalities
  - neuroendocrinology: abnormal growth hormone, prolactin, cortisol, and ACTH
  - neuropsychology: global defects seen in attention, language, and memory suggest lack of connectivity of neural networks
  - environmental: indirect evidence of cannabis use, geographical variance, winter season of birth, obstetrical complications, and prenatal viral exposure

### Pathophysiology

- neurodegenerative theory
  - natural history may be a rapid or gradual decline in function and ability to communicate
  - glutamate system may mediate progressive degeneration by excitotoxic mechanism which leads to production of free radicals
- neurodevelopmental theory: abnormal development of the brain from prenatal life
  - neurons fail to migrate correctly, make inappropriate connections, and break down in later life
  - inappropriate apoptosis during neurodevelopment resulting in faulty connections between neurons

### Management of Schizophrenia

- biological
  - acute treatment and maintenance with antipsychotics ± anticonvulsants ± anxiolytics
- psychosocial
  - psychotherapy (individual, family, group): supportive, CBT (see CBT, PS41)
  - assertive community treatment (ACT): mobile mental health teams that provide individualized treatment in the community and help patients with medication adherence, basic living skills, social support, job placements, and community resources
  - social skills training, employment programs, disability benefits
  - housing (group home, boarding home, transitional home)

### Course and Prognosis

- the majority of individuals display some type of prodromal phase
- course is variable: some individuals have exacerbations and remissions and others remain chronically ill; accurate prediction of the long term outcome is not possible
- early in the illness, negative symptoms may be prominent; positive symptoms appear and typically diminish with treatment; negative symptoms may become more prominent and more disabling
- over time: 1/3 improve, 1/3 remain the same, 1/3 worsen

#### Relationship Between Duration of Untreated Psychosis (DUP) and Outcome in First-episode Schizophrenia

*Am J Psychiatry* 2005;162:1785-1804

**Purpose:** To review the association between DUP and symptom severity at first treatment contact, and between DUP and treatment outcomes.

**Study Characteristics:** Critical review and meta-analysis of 43 studies with 4177 patients.

**Participants:** Patients with non-affective psychotic disorders at or close to first treatment.

**Results:** Shorter DUP was associated with greater response to antipsychotic treatment, as measured by global psychopathology, positive symptoms, negative symptoms, and functional outcomes. At the time of treatment initiation, longer DUP was associated with the severity of negative symptoms but not with the severity of positive symptoms, global psychopathology, or neurocognitive function.

**Conclusions:** DUP may be a potentially modifiable prognostic factor.

#### Supportive Evidence for Dopamine Hypothesis

- DA agonists exacerbate schizophrenia
- Antipsychotic drugs act by blocking post-synaptic DA receptors
- Potency of many antipsychotic drugs correlates with D2 blockade of post-synaptic receptors
- Antipsychotic drugs are associated with an increase in the number of D2 and D4 post-synaptic receptors

#### Good Prognostic Factors

- Acute onset
- Later age at onset
- Shorter duration of prodrome
- Female gender
- Good cognitive functioning
- Good premorbid functioning
- No family history
- Presence of affective symptoms
- Absence of structural brain abnormalities
- Good response to drugs
- Good support system

## Schizophreniform Disorder

- **diagnosis:** criteria A, D and E of schizophrenia are met; an episode of the disorder lasts from 1-6 mo. If the symptoms have extended past 6 mo the diagnosis becomes schizophrenia
- **treatment:** similar to acute schizophrenia
- **prognosis:** better than schizophrenia; begins and ends more abruptly; good pre- and post-morbid function

## Brief Psychotic Disorder

- **diagnosis:** acute psychosis (presence of 1 or more positive symptoms in criteria A 1-4 of schizophrenia) lasting from 1 day to 1 mo, with eventual full return to premorbid level of functioning
- can occur after a stressful event or postpartum (see *Postpartum Mood Disorders*, PS12)
- **treatment:** secure environment, antipsychotics, anxiolytics
- **prognosis:** good, self-limiting, should return to pre-morbid function in about 1 mo

## Schizoaffective Disorder

### DSM-IV-TR Diagnostic Criteria for Schizoaffective Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).  
American Psychiatric Association.

- A. uninterrupted period of illness during which there is either a MDE, manic episode, or a mixed episode concurrent with symptoms meeting criteria A for schizophrenia
  - B. in the same period, delusions or hallucinations for  $\geq 2$  wk in the absence of prominent mood symptoms
  - C. symptoms that meet criteria for a mood episode are present for a substantial portion of total duration of active and residual periods of the illness
  - D. the disturbance is not due to the direct physiological effects of a substance or GMC
- **treatment:** antipsychotics, mood stabilizers, antidepressants
  - **prognosis:** between that of schizophrenia and of mood disorder

## Delusional Disorder

### DSM-IV-TR Diagnostic Criteria for Delusional Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).  
American Psychiatric Association.

- A. non-bizarre delusions for  $\geq 1$  mo
  - B. criterion A for schizophrenia has never been met (though patient may have tactile or olfactory hallucinations if they are related to the delusional theme)
  - C. functioning not markedly impaired; behaviour not obviously odd or bizarre
  - D. if mood episodes occur concurrently with delusions, total duration has been brief relative to duration of the delusional periods
  - E. the disturbance is not due to the direct physiological effects of a substance or GMC
- **subtypes:** erotomanic, grandiose, jealous, persecutory, somatic, mixed, unspecified
  - **treatment:** psychotherapy, antipsychotics, antidepressants
  - **prognosis:** chronic, unremitting course but high level of functioning

Non-bizarre delusions involve situations that could occur in real life (e.g. being followed, poisoned, loved at a distance).

## Shared Psychotic Disorder (Folie à Deux)

- **diagnosis:** delusion that develops in an individual who is in a close relationship with another person who already has a psychotic disorder with prominent delusions; the delusion is similar in content to that of the other person
- **treatment:** separation of the two people results in the disappearance of the delusion in the healthier member; antipsychotics may play a role
- **prognosis:** good

# Mood Disorders

## Definitions

- mood disorders are defined by the presence of mood episodes
- mood episodes represent a combination of symptoms comprising a predominant mood state that is abnormal in quality or duration (e.g. major depressive, manic, mixed, hypomanic)
- types of mood disorders include:
  - depressive (major depressive disorder, dysthymia)
  - bipolar (bipolar I/II disorder, cyclothymia)
  - secondary to GMC, substances, medications

**Table 2. Secondary Causes of Mood Disorders**

Category	Examples
<b>V</b> Vascular	Cardiomyopathy, CHF, MI, CVA
<b>I</b> Infectious	Encephalitis/meningitis, hepatitis, TB, syphilis, HIV/AIDS
<b>N</b> Neoplastic	Pancreatic cancer, carcinoid, pheochromocytoma, CNS tumour
<b>D</b> Degenerative	Huntington's disease, multiple sclerosis, tuberous sclerosis, degenerative (vascular, Alzheimer's dementia)
<b>I</b> Intoxication/Drugs/Deficiencies	Antihypertensives, antiparkinsonian, hormones, steroids, antituberculous, interferon, antineoplastic medications, vitamin deficiencies (Wernicke's encephalopathy, beriberi, pellagra, pernicious anemia)
<b>C</b> Congenital	—
<b>A</b> Autoimmune	SLE, polyarteritis nodosa
<b>T</b> Traumatic	—
<b>E</b> Endocrine/Metabolic	Hypothyroidism, hyperthyroidism, hypopituitarism, SIADH, porphyria, Wilson's disease, diabetes

## Medical Workup of Mood Disorder

- **routine screening:** physical examination, CBC, thyroid function test, electrolytes, extended electrolytes, urinalysis, drug screen
- **additional screening:** neurological consultation, chest x-ray, ECG, CT

# Mood Episodes

## DSM-IV-TR Criteria for Major Depressive Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- A.  $\geq 5$  of the following symptoms have been present during the same 2-wk period and represent a change from previous functioning; at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure (anhedonia)

**Note:** Do not include symptoms that are clearly due to a GMC, mood-incongruent delusions or hallucinations

- depressed mood most of the day, nearly every day, as indicated by either subjective report or observation made by others
  - markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day
  - significant weight loss when not dieting or weight gain, or decrease or increase in appetite nearly every day
  - insomnia or hypersomnia nearly every day
  - psychomotor agitation or retardation nearly every day
  - fatigue or loss of energy nearly every day
  - feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)
  - diminished ability to think or concentrate, or indecisiveness, nearly every day
  - recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide
- B. the symptoms do not meet criteria for a mixed episode (see PS10)
- C. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- D. the symptoms are not due to the direct physiological effects of a substance or a GMC
- E. the symptoms are not better accounted for by bereavement; the symptoms persist for longer than 2 mo; symptoms are characterized by marked functional impairment, morbid preoccupation with worthlessness, suicidal ideation, psychotic symptoms, or psychomotor retardation

### Criteria for Depression ( $\geq 5$ )

#### MSIGECAPS

**M**ood: depressed  
**S**leep: increased/decreased  
**I**nterest: decreased  
**G**uilt  
**E**nergy: decreased  
**C**oncentration: decreased  
**A**ppetite: increased/decreased  
**P**sychomotor: agitation/retardation  
**S**uicidal ideation

**DSM-IV-TR Criteria for Manic Episode**

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).  
American Psychiatric Association.

- A. a distinct period of abnormally and persistently elevated, expansive, or irritable mood, lasting  $\geq 1$  wk (or any duration if hospitalization is necessary) (note: in DSM-5, "persistently increased goal-directed activity or energy" has been added to criteria A)
  - B. during the period of mood disturbance,  $\geq 3$  of the following symptoms have persisted (4 if the mood is only irritable) and have been present to a significant degree:
    - inflated self-esteem or grandiosity
    - decreased need for sleep (e.g. feels rested after only 3 h of sleep)
    - more talkative than usual or pressure to keep talking
    - flight of ideas or subjective experience that thoughts are racing
    - distractibility (i.e. attention too easily drawn to unimportant or irrelevant external stimuli)
    - increase in goal-directed activity (either socially, at work or school, or sexually) or psychomotor agitation
    - excessive involvement in pleasurable activities that have a high potential for painful consequences (e.g. engaging in unrestrained shopping sprees, sexual indiscretions, or foolish business investments)
  - C. the symptoms do not meet criteria for a mixed episode (see below)
  - D. the mood disturbance is sufficiently severe to cause marked impairment in occupational functioning or in usual social activities or relationships with others, or to necessitate hospitalization to prevent harm to self or others, or there are psychotic features
  - E. the symptoms are not due to the direct physiological effects of a substance (e.g. drug of abuse, medication, or other treatment) or a GMC (e.g. hyperthyroidism).
- Note:** Manic-like episodes that are clearly caused by somatic antidepressant treatment (e.g. medication, ECT therapy, light therapy) should not count toward a diagnosis of Bipolar I Disorder (this has been removed in DSM-5)

**Criteria for Mania ( $\geq 3$ )****GST PAID**

Grandiosity

Sleep (decreased need)

Talkative

Pleasurable activities, Painful consequences

Activity

Ideas (flight of)

Distractible

**Mixed Episode**

- criterion met for both manic episode and MDE nearly every day for 1 wk
- criteria D and E of manic episodes are met
- **Note:** in DSM-5, mixed episode is no longer a separate mood diagnosis; instead, depressed episodes and manic episodes can have a "with mixed features" specifier

**Hypomanic Episode**

- criterion A of a manic episode is met, but duration is  $\geq 4$  d
- criteria B and E of manic episodes are met
- episode associated with an uncharacteristic decline in functioning that is observable by others
- change in function is not severe enough to cause marked impairment in social or occupational functioning or to necessitate hospitalization
- absence of psychotic features

## Depressive Disorders

**MAJOR DEPRESSIVE DISORDER****DSM-IV-TR Diagnostic Criteria for Major Depressive Disorder (MDD), Single Episode (vs. Recurrent)**

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).  
American Psychiatric Association.

- A. presence of a single MDE (vs. recurrent, which requires presence of two or more MDEs; to be considered separate episodes, there must be an interval of at least 2 consecutive months in which criteria are not met for a MDE)
  - B. the MDE is not better accounted for by Schizoaffective Disorder and is not superimposed on Schizophrenia, Schizophreniform Disorder, Delusional Disorder, or Psychotic Disorder NOS
  - C. there has never been a Manic Episode, a Mixed Episode, or a Hypomanic Episode
- **Note:** This exclusion does not apply if all of the manic-like, mixed-like, or hypomanic-like episodes are substance or treatment-induced or are due to the direct physiological effects of a GMC

**Features/Specifiers**

- **psychotic:** with hallucinations or delusions
- **chronic:** lasting 2 yr or more
- **catatonic:** at least two of: motor immobility, excessive motor activity, extreme negativism or mutism, peculiarities of voluntary movement, echolalia or echopraxia
- **melancholic:** quality of mood is distinctly depressed, mood is worse in the morning, early morning awakening, marked weight loss, excessive guilt, psychomotor retardation
- **atypical:** increased sleep, weight gain, leaden paralysis, rejection hypersensitivity
- **postpartum:** (see *Postpartum Mood Disorders*, PS12)
- **seasonal:** pattern of onset at the same time each year (most often in the fall or winter)
- **Note:** in DSM-5 the specifiers have changed to include: with anxious distress, with mixed features, with melancholic features, with atypical features, with mood-congruent psychotic features, with mood-incongruent psychotic features, with catatonia, with peripartum onset, with seasonal pattern

## Epidemiology

- prevalence: 12.2%
  - lifetime prevalence: male 2.9%, female 5%
  - annual prevalence: peak prevalence age 15-25 yr (M:F = 1:2)

## Etiology

- biological
  - genetic: 65-75% MZ twins; 14-19% DZ twins
  - neurotransmitter dysfunction: decreased activity of 5HT, NE and DA at the level of the synapse; changes in GABA and glutamate; changes in brain circuitry
  - neuroendocrine dysfunction: increased production of corticotropin causing excessive HPA axis activity
  - neuroanatomy: smaller frontal lobes and hippocampal volume; increased ventricle sizes
  - neurophysiologic: decreased REM latency and slow-wave sleep; increased REM length
  - secondary to GMC
- psychosocial
  - psychodynamic (e.g. low self-esteem)
  - cognitive (e.g. negative thinking)
  - environmental factors (e.g. job loss, bereavement, history of abuse, early life adversity)
  - co-morbid psychiatric diagnoses (e.g. anxiety, substance abuse, developmental disability, dementia, eating disorder)

## Risk Factors

- sex: female > male
- age: onset between 25-50 yr of age
- family history: depression, alcohol abuse, sociopathy
- childhood experiences: loss of parent before age 11, negative home environment (abuse, neglect)
- personality: insecure, dependent, obsessional
- recent stressors: illness, financial, legal
- postpartum <6 mo
- lack of intimate, confiding relationships or social isolation

## Depression in the Elderly

- affects about 15% of community residents >65 yr old; up to 50% in nursing homes
- high suicide risk due to social isolation, chronic medical illness
- suicide peak: males aged 80-90; females aged 50-65
- dyphoria may not be a reliable indicator of depression in those >85 yr
- often present with somatic complaints (e.g. changes in weight, sleep, energy) or anxiety symptoms
- may have prominent cognitive changes after onset of mood symptoms (dementia syndrome of depression)
- refer to Table 4 (see *Dementia*, PS21) to compare with delirium and dementia

## Treatment

- biological: antidepressants primarily; could also consider lithium, antipsychotics, anxiolytics, light therapy, ECT, repetitive transcranial magnetic stimulation (rTMS)
- psychological
  - individual therapy (psychodynamic, interpersonal, CBT), family therapy, group therapy
- social: vocational rehabilitation, social skills training
- experimental: magnetic stimulation therapy (MST), deep brain stimulation, vagal nerve stimulation
- studies suggest CBT with pharmacotherapy results in better outcomes

## Prognosis

- one year after diagnosis of a MDE without treatment: 40% of individuals still have symptoms that are sufficiently severe to meet criteria for a full MDE, 20% continue to have some symptoms that no longer meet criteria for a MDE, 40% have no mood disorder

## DYSTHYMIA

### DSM-IV-TR Diagnostic Criteria for Dysthymic Disorder

**Note: in DSM-5 this has been changed to Persistent Depressive Disorder**

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- depressed mood for most of the day, for more days than not, as indicated either by subjective account or observation by others, for  $\geq 2$  yr  
Note: In children and adolescents, mood can be irritable and duration must be at least 1 yr
- presence, while depressed, of  $\geq 2$  of the following
  - poor appetite or overeating
  - insomnia or hypersomnia
  - low energy or fatigue

### Antidepressants for Depression in Medical Illness

*Cochrane DB Syst Rev* 2010; Issue 3

This systematic review and meta-analysis of 51 RCTs (3603 patients) compared antidepressants to placebo in patients with a physical disorder (e.g. cancer, MI) who have been diagnosed as depressed (including major depression, adjustment disorder, and dysthymia).

**Conclusions:** Antidepressants, including SSRIs and TCAs, cause a significant improvement in patients with a physical illness, as compared to placebo.

### St. John's Wort for Major Depression

*Cochrane DB Syst Rev* 2008;4:CD000448

**Study:** Systematic review of trials that were (1) randomized, double-blinded (2) with patients with major depression (3) comparing St. John's wort (hypericum extracts) with placebo or standard antidepressants and (4) included clinical outcomes.

**Patients:** 5489 patients with major depression.

**Outcomes:** 1. Effectiveness: treatment response measured by a depression scale 2. Safety: the proportion of patients who dropped out due to adverse effects.

**Intervention:** St. John's wort vs. placebo; St. John's wort vs. standard antidepressants.

**Results:** 29 trials, 5489 patients, with 18 comparisons with placebo and 17 with antidepressants. St. John's wort is more effective than placebo (response rate ratio = 1.87, 95% CI), and similarly effective as antidepressants (RRR = 1.02, 95% CI). Less adverse effects with hypericum extracts. However, the effect size is dependent on the country of origin.

### Cognitive Therapy vs. Medications in the Treatment of Moderate to Severe Depression

*Arch Gen Psychiatry* 2005;62:409-416

**Study:** Randomized control trial.

**Patients:** 240 outpatients with moderate to severe MDD, aged 18-70.

**Intervention:** 16 wk of paroxetine with or without augmentation with lithium carbonate or desipramine hydrochloride (n=120) versus cognitive behavioural therapy (n=60). Response up to 8 wk was controlled by pill placebo (n=60)

**Main Outcomes:** The Hamilton Depression Rating scale was used to determine response to treatment.

**Results:** At 8 wk, 50% (95%CI 41-59%) of patients on medication and 43% (95%CI 31-56%) of patients on CBT had responded in comparison to 25% (95%CI 16-38%) of patients on pill placebo. There was no significant difference between medication and CBT. At 16 wk, 46% of patients on medication and 40% of patients on CBT achieved remission.

**Summary:** There is no difference in efficacy between CBT vs. paroxetine in the treatment of moderate to severe depression.

- low self-esteem
  - poor concentration or difficulty making decisions
  - feelings of hopelessness
- C. during the 2-yr period (1 yr for children or adolescents) of the disturbance, the person has never been without the symptoms in criteria A and B for more than 2 mo at a time
- D. no MDE has been present during the first 2 yr of the disturbance (1 yr for children and adolescents); i.e. the disturbance is not better accounted for by chronic MDD, or MDD in partial remission
- E. there has never been a Manic Episode, a Mixed Episode, or a Hypomanic Episode, and criteria have never been met for Cyclothymic Disorder
- F. the disturbance does not occur exclusively during the course of a chronic psychotic disorder, such as Schizophrenia or Delusional Disorder
- G. the symptoms are not due to the direct physiological effects of a substance or a GMC
- H. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

### Epidemiology

- point prevalence: 3%; life prevalence: 6%; M:F = 1:2-3

### Treatment

- psychological
  - principal treatment for dysthymia
  - individual, group, and family therapy
- biological
  - antidepressant therapy (SSRIs/SNRIs) as an outpatient

## Postpartum Mood Disorders

### Postpartum "Blues"

- transient period of mild depression, mood instability, anxiety, decreased concentration, increased concern over own health and health of baby – considered to be normal emotional changes related to the puerperium
- occurs in 50-80% of mothers; begins 2-4 d postpartum, usually lasts 48 h, can last up to 10 d
- does not require psychotropic medication
- patient at increased risk of developing postpartum depression

### Postpartum Depression (PPD)

- **diagnosis:** MDE, onset within 4 wk postpartum
- **clinical presentation:**
  - typically lasts 2 to 6 mo; residual symptoms can last up to 1 yr
  - may present with psychosis – rare (0.2%), usually associated with mania, but also with MDE
  - severe symptoms include extreme disinterest in baby, suicidal and infanticidal ideation
- **epidemiology:** occurs in 10% of mothers, risk of recurrence 50%
- **risk factors:**
  - previous history of a mood disorder (postpartum or otherwise)
  - psychosocial factors: stressful life events, unemployment, marital conflict, lack of social support, unwanted pregnancy, colicky or sick infant
- **treatment:**
  - psychotherapy (CBT or IPT)
  - short-term safety of maternal SSRIs for breastfeeding infants established; long-term effects unknown
  - if depression severe, consider ECT
- **prognosis:**
  - impact on child development: increased risk of cognitive delay, insecure attachment, behavioural disorders
  - treatment of mother improves outcome for child at 8 mo through increased mother-child interaction

#### Selective Serotonin Reuptake Inhibitors in Pregnancy and Infant Outcomes

*Paediatr Child Health* 2011;16:562-563

Study: Canadian Paediatric Society (CPS) Clinical practice guidelines.

**Recommendations:** It is important to treat depression in pregnancy. There is no evidence that SSRIs increase the risk of major malformations. There is conflicting evidence concerning the association of paroxetine and cardiac malformations. SSRIs are not contraindicated while breast-feeding.

## Bipolar Disorders

### BIPOLAR I / BIPOLAR II DISORDER

#### Definition

- Bipolar I Disorder
  - disorder in which at least one manic or mixed episode has occurred
  - commonly accompanied by at least 1 MDE but not required for diagnosis
- Bipolar II Disorder
  - disorder in which there is at least 1 MDE and at least 1 hypomanic episode
  - no past manic or mixed episodes

### Epidemiology

- prevalence: 0.6-0.9%; M:F = 1:1
- age of onset: teens to 20's

### Risk Factors

- high SES
- genetic: 60-65% of bipolar patients have family history of major mood disorders

### Classification

- classification of bipolar disorder involves describing the current or most recent mood episode as either manic, hypomanic, mixed or depressed
- the current or most recent episode can be further classified as without psychotic features, with psychotic features, with catatonic features, with postpartum onset, with seasonal pattern, with rapid cycling (at least 4 episodes of a mood disturbance in the previous 12 mo that meet criteria for a major depressive, manic, mixed, or hypomanic episode)

### Treatment

- biological: lithium, anticonvulsants, antipsychotics, antidepressants, ECT
- psychological: supportive or psychodynamic psychotherapy, CBT, ITP or interpersonal social rhythm therapy
- social: vocational rehabilitation, consider leave of absence from school/work, consider substitute decision maker for finances, drug and EtOH cessation, sleep hygiene, social skills training, education for family members

### Course and Prognosis

- high suicide rate (15% mortality from suicide)
- relapsing and remitting course with alternating manic and depressive episodes; depressive symptoms tend to occur more frequently and last longer than manic episodes
- patients spend almost half of their lives symptomatic
- may switch rapidly between depression and mania without any period of euthymia in between
- high recurrence rate for mania – 90% will have a subsequent episode in the next 5 yr

## CYCLOTHYMIA

### Diagnosis

- presence of numerous periods of hypomanic and depressive symptoms (not meeting criteria for MDE) for  $\geq 2$  yr; never without symptoms for  $>2$  mo
- no MDE, manic or mixed episodes, no evidence of psychosis
- symptoms are not due to the direct physiological effects of a substance or GMC
- symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

### Treatment

- similar to Bipolar I: anticonvulsants  $\pm$  psychotherapy

Patients with bipolar disorder are at higher risk for suicide when they switch from mania to depression, especially as they become aware of consequences of their behaviour during the manic episode.

Treatment of bipolar depression must be done extremely cautiously, as a switch from depression to mania can result; monotherapy with antidepressants should be avoided.

#### A Randomized Controlled Trial of Cognitive Therapy for Bipolar Disorder: Focus on Long-term Change

*J Clin Psychiatry* 2006;67:277-286

**Study:** Randomized, blinded clinical trial.

**Patients:** 52 patients with DSM-IV bipolar 1 or 2 disorder.

**Intervention:** Patients allocated to either a 6 mo trial of cognitive therapy (CT) with emotive techniques or treatment as usual. Both groups received mood stabilizers.

**Main Outcomes:** Relapse rates, dysfunctional attitudes, psychosocial functioning, hopelessness, self-control, medication adherence. Patients were assessed by independent raters blinded to treatment group.

**Results:** At 6 mo, CT patients experienced fewer depressive symptoms and fewer dysfunctional attitudes. There was a non-significant ( $p=.06$ ) trend to greater time to depressive relapse. At 12 mo follow-up, CT patients had lower Young Mania Rating scores and improved behavioural self-control. At 18 mo, CT patients reported less severity of illness.

**Conclusions:** CT appears to provide benefits in the 12 mo after completion of therapy.

## Anxiety Disorders

### Definition

- anxiety is a universal human characteristic involving tension, apprehension, or even terror
- serves as an adaptive mechanism to warn about an external threat by activating the sympathetic nervous system (fight or flight)
- manifestations of anxiety can be described through:
  - physiology: main brain structure involved is the amygdala (fear conditioning); neurotransmitters involved include 5-HT, cholecystokinin, epinephrine, norepinephrine, DA
  - psychology: one's perception of a given situation is distorted which causes one to believe it is threatening in some way
  - behaviour: once feeling threatened, one responds by escaping or facing the situation, thereby causing a disruption in daily functioning
- anxiety becomes pathological when:
  - fear is greatly out of proportion to risk/severity of threat
  - response continues beyond existence of threat or becomes generalized to other similar or dissimilar situations
  - social or occupational functioning is impaired

## Differential Diagnosis

**Table 3. Differential Diagnosis of Anxiety Disorders**

<b>Cardiovascular</b>	Post-MI, arrhythmia, congestive heart failure, pulmonary embolus, mitral valve prolapse
<b>Respiratory</b>	Asthma, COPD, pneumonia, hyperventilation
<b>Endocrine</b>	Hyperthyroidism, pheochromocytoma, hypoglycemia, hyperadrenalism, hyperparathyroidism
<b>Metabolic</b>	Vitamin B <sub>12</sub> deficiency, porphyria
<b>Neurologic</b>	Neoplasm, vestibular dysfunction, encephalitis
<b>Substance-Induced</b>	Intoxication (caffeine, amphetamines, cocaine, thyroid preparations, OTC for colds/decongestants), withdrawal (benzodiazepines, alcohol)
<b>Other Psychiatric Disorders</b>	Psychotic disorders, mood disorders, personality disorders (OCPD), somatoform disorders

## Medical Workup of Anxiety Disorder

- routine screening: physical examination, CBC, thyroid function test, electrolytes, urinalysis, urine drug screening
- additional screening: neurological consultation, chest x-ray, ECG, CT

## Panic Disorder

### DSM-IV-TR Diagnostic Criteria for Panic Disorder without Agoraphobia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).  
American Psychiatric Association.

- A. both (1) and (2)
- (1) recurrent unexpected panic attacks: a discrete period of intense fear or discomfort, in which  $\geq 4$  of the following symptoms develop abruptly and reach a peak within 10 min
    - ♦ palpitations, pounding heart, or accelerated heart rate
    - ♦ sweating
    - ♦ trembling or shaking
    - ♦ sensations of shortness of breath or smothering
    - ♦ feeling of choking
    - ♦ chest pain or discomfort
    - ♦ nausea or abdominal distress
    - ♦ feeling dizzy, unsteady, lightheaded, or faint
    - ♦ derealization (feelings of unreality) or depersonalization (being detached from oneself)
    - ♦ fear of losing control or going crazy
    - ♦ fear of dying
    - ♦ paresthesias (numbness or tingling sensations), chills or hot flushes
  - (2) at least one of the attacks has been followed by 1 mo (or more) of  $\geq 1$  of the following
    - ♦ persistent concern about having additional attacks
    - ♦ worry about the implications of the attack or its consequences (e.g. losing control, having a heart attack, "going crazy")
    - ♦ a significant change in behaviour related to the attacks
- B. absence of agoraphobia
- C. the panic attacks are not due to the direct physiological effects of a substance or GMC
- D. the panic attacks are not better accounted for by another mental disorder, such as social phobia, specific phobia, obsessive-compulsive disorder, post-traumatic stress disorder, separation anxiety disorder

### Epidemiology

- prevalence: 1.5-5% (one of the top five most common reasons to see a family doctor); M:F = 1:2-3
- onset: average late 20's, familial pattern

### Treatment

- psychological
  - CBT: interoceptive exposure (eliciting symptoms of a panic attack and learning to tolerate the symptoms without coping strategies); cognitive restructuring (addressing underlying beliefs regarding the panic attacks), relaxation techniques (visualization, box-breathing)
- pharmacological
  - SSRIs: fluoxetine, citalopram, paroxetine, fluvoxamine, sertraline
  - SNRI: venlafaxine
  - with SSRI/SNRI start with low doses, titrate up slowly
  - anxiety disorders often require treatment at higher doses for a longer period of time (i.e. up to 8-12 wk than used for depression)
  - to prevent non-compliance due to physical side effects, explain symptoms to expect prior to initiation of therapy
  - other antidepressants (TCAs, mirtazapine, MAOIs)
    - ♦ consider avoiding bupropion due to stimulating effects
  - benzodiazepines (short term, low dose, regular schedule, long half-life, avoid prn use)

#### Pharmacotherapy for Anxiety Disorders in Children and Adolescents

*Cochrane DB Syst Rev* 2009;3:CD005170

**Study:** Systematic review of 22 randomized control trials to assess the efficacy and tolerability of medication for treating pediatric anxiety disorders.

**Methods:** Literature searches of MEDLINE, EMBASE, PsycINFO (1966-2008).

**Patients:** Children/adolescents under the age of 18 diagnosed with any anxiety disorder according to DSM criteria.

**Intervention:** Medication (benzodiazepines, SSRIs and TCAs) vs. placebo.

**Results:** The majority of the trials assessed the efficacy of SSRIs (N = 15). Medication and placebo response occurred in 58.1% and 31.5% of patients, respectively (number of studies = 14).

**Reviewers' Conclusion:** Medication treatments can be effective in pediatric anxiety disorders, acting to reduce core symptoms, and should be considered as part of the treatment of these disorders. The greatest number of trials showing efficacy to date have assessed the SSRIs in treating pediatric OCD. The routine use of benzodiazepines cannot be recommended.

**Figure 2. Panic attack**

#### Criteria for Panic Disorder ( $\geq 4$ )

##### STUDENTS FEAR THE 3 Cs

Sweating  
Trembling  
Unsteadiness, dizziness  
Depersonalization, Derealization  
Excessive heart rate, palpitations  
Nausea  
Tingling  
Shortness of breath

**Fear of dying, losing control, going crazy**

**3 Cs: Chest pain, Chills, Choking**

#### Panic Attack vs. Panic Disorder

Panic disorder consists of panic attacks + other criteria.

Panic attack is not a codable disorder and can occur in the context of many different disorders.

#### Starting Medication for Anxiety

Start low, go slow, aim high and explain symptoms to expect prior to initiation of therapy.

**Prognosis**

- 6-10 yr post-treatment: 30% well, 40-50% improved, 20-30% no change or worse
- clinical course: chronic, but episodic with psychosocial stressors

**Panic Disorder with Agoraphobia**

- agoraphobia
  - anxiety about being in places or situations from which escape might be difficult (or embarrassing) or where help may not be available in the event of having an unexpected panic attack
  - fears commonly involve situations such as being out alone, being in a crowd, standing in a line, or travelling on a bus
- situations are avoided, endured with anxiety or panic, or require companion
- treatment: as per panic disorder

**Generalized Anxiety Disorder (GAD)****DSM-IV-TR Diagnostic Criteria for Generalized Anxiety Disorder**

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- excessive anxiety and worry (apprehensive expectation), occurring more days than not for at least 6 mo, about a number of events or activities (such as work or school performance)
- the person finds it difficult to control the worry
- the anxiety and worry are associated with  $\geq 3$  of the following 6 symptoms (with at least some symptoms present for more days than not for the past 6 mo)
 

**Note:** Only one item is required in children

  - restlessness or feeling keyed up or on edge
  - being easily fatigued
  - difficulty concentrating or mind going blank
  - irritability
  - muscle tension
  - sleep disturbance (difficulty falling or staying asleep, or restless unsatisfying sleep)
- the focus of the anxiety and worry is not confined to features of an Axis I disorder, such as panic disorder, social phobia, etc.
- the anxiety, worry, or physical symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- the disturbance is not due to the direct physiological effects of a substance or a GMC and does not occur exclusively during a Mood Disorder, a Psychotic Disorder, or a Pervasive Developmental Disorder

**Criteria for GAD ( $\geq 3$ )****BE SKIM**

Blank mind  
Easily fatigued  
Sleep disturbance  
Keyed up  
Irritability  
Muscle tension

**Epidemiology**

- 1-yr prevalence: 3-8%; M:F = 1:2
  - if considering only those receiving inpatient treatment, ratio is 1:1
- most commonly presents in early adulthood

**Treatment**

- lifestyle: caffeine and EtOH avoidance, sleep hygiene
- psychological: CBT including relaxation techniques, mindfulness
- biological
  - SSRIs and SNRIs are 1st line (paroxetine, escitalopram, sertraline, venlafaxine XL)
  - 2nd line: bupropion (caution due to stimulating effects), buspirone (tid dosing)
  - add-on benzodiazepines (short term, low dose, regular schedule, long half-life, avoid prn)
  - $\beta$ -blockers not recommended

**Prognosis**

- chronically anxious adults become less so with age
- depends on pre-morbid personality functioning, stability of relationships, work, and severity of environmental stress
- difficult to treat

**Phobic Disorders****Specific Phobia**

- definition: marked and persistent fear that is excessive or unreasonable, cued by presence or anticipation of a specific object or situation
- lifetime prevalence 12-16%; M:F ratio variable
- types: animal/insect, environment (heights, storms), blood/injection/injury, situational (airplane, closed spaces), other (loud noise, clowns)

**Social Phobia (Social Anxiety Disorder)**

- definition: marked and persistent fear of social or performance situations in which one is exposed to unfamiliar people or to possible scrutiny by others; fearing he/she will act in a way that may be humiliating or embarrassing (e.g. public speaking, initiating or maintaining conversation, dating, eating in public)
- lifetime prevalence may be as high as 13-16%; F>M

**Diagnostic Criteria for Phobic Disorders**

- exposure to stimulus almost invariably provokes an immediate anxiety response; may present as a panic attack
- person recognizes fear as excessive or unreasonable
- situations are avoided or endured with anxiety/distress
- significant interference with daily routine, occupational/social functioning, and/or marked distress
- if person is <18 yr, duration is at least 6 mo

**Treatment**

- psychological
  - cognitive behaviour therapy (focusing on both in vivo and virtual exposure therapy – gradually facing feared situations)
  - behavioural therapy is more efficacious than medication
- biological
  - $\beta$ -blockers or benzodiazepines in acute situations (e.g. public speaking)

**Prognosis**

- chronic

## Obsessive-Compulsive Disorder (OCD)

**DSM-IV-TR Diagnostic Criteria for Obsessive Compulsive Disorder**

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).

American Psychiatric Association.

**A. either obsessions or compulsions:****obsessions** as defined by (1), (2), (3), and (4)

- (1) recurrent and persistent thoughts, impulses, or images that are experienced, at some time during the disturbance, as intrusive and inappropriate and that cause marked anxiety or distress
- (2) the thoughts, impulses, or images are not simply excessive worries about real-life problems
- (3) the person attempts to ignore or suppress such thoughts, impulses, or images, or to neutralize them with some other thought or action
- (4) the person recognizes that the obsessional thoughts, impulses, or images are a product of his or her own mind (not imposed)

**compulsions** as defined by (1) and (2)

- (1) repetitive behaviours or mental acts that the person feels driven to perform in response to an obsession, or according to rules that must be applied rigidly
- (2) the behaviours or mental acts are aimed at preventing or reducing distress or preventing some dreaded event or situation; however, these behaviours or mental acts either are not connected in a realistic way with what they are designed to neutralize/prevent or are clearly excessive

**B. at some point during the course of the disorder, the person has recognized that the obsessions or compulsions are excessive or unreasonable (ego-dystonic)**

**Note:** This does not apply to children

- C. the obsessions or compulsions cause marked distress, are time-consuming (take  $\geq 1$  h a day), or significantly interfere with the person's normal routine, occupational (or academic) functioning, or usual social activities or relationships**
- D. if another Axis I disorder is present, the content of the obsessions or compulsions is not restricted to it (e.g. preoccupation with food in the presence of an Eating Disorder)**
- E. the disturbance is not due to the direct physiological effects of a substance or a GMC**

**Epidemiology**

- lifetime prevalence rates 2-3%; M=F
- rate of OCD in first-degree relatives is higher than in the general population

**Treatment**

- CBT: exposure with response prevention (ERP) – involves exposure to feared situations with the addition of preventing the compulsive behaviours; cognitive strategies include challenging underlying beliefs
- pharmacotherapy: SSRIs/SNRIs, clomipramine; adjunctive risperidone

**Prognosis**

- tends to be refractory and chronic

## Post-Traumatic Stress Disorder (PTSD)

### DSM-IV-TR Diagnostic Criteria for Post-Traumatic Stress Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).

American Psychiatric Association.

- A. the person has been exposed to a traumatic event in which both of the following were present
  - (1) the person experienced, witnessed, or was confronted with an event or events that involved actual or threatened death or serious injury, or a threat to the physical integrity of self or others
  - (2) the person's response involved intense fear, helplessness, or horror

**Note:** in children, this may be expressed instead by disorganized or agitated behaviour
- B. the traumatic event is persistently re-experienced in one (or more) of the following ways:
  - (1) recurrent and intrusive distressing recollections of the event, including images, thoughts, or perceptions

**Note:** in children, repetitive play may occur in which themes or aspects of the trauma are expressed

  - (2) recurrent distressing dreams of the event

**Note:** in children, there may be frightening dreams without recognizable content

  - (3) acting or feeling as if the traumatic event were recurring (includes a sense of reliving the experience, illusions, hallucinations, and dissociative flashback episodes, including those that occur on awakening or when intoxicated)

**Note:** in children, trauma-specific reenactment may occur

  - (4) intense psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event
  - (5) physiological reactivity on exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event
- C. persistent avoidance of stimuli associated with the trauma and numbing of general responsiveness (not present before the trauma), as indicated by  $\geq 3$  of the following:
  - (1) efforts to avoid thoughts, feelings, or conversations associated with the trauma
  - (2) efforts to avoid activities, places, or people that arouse recollections of the trauma
  - (3) inability to recall an important aspect of the trauma
  - (4) markedly diminished interest or participation in significant activities
  - (5) feeling of detachment or estrangement from others
  - (6) restricted range of affect (e.g. unable to have loving feelings)
  - (7) sense of a foreshortened future (e.g. does not expect to have a career, marriage, children, or a normal life span)
- D. persistent symptoms of increased arousal (not present before the trauma), as indicated by  $\geq 2$  of the following:
  - (1) difficulty falling or staying asleep
  - (2) irritability or outbursts of anger
  - (3) difficulty concentrating
  - (4) hypervigilance
  - (5) exaggerated startle response
- E. duration of the disturbance (symptoms in Criteria B, C, and D) is  $\geq 1$  mo
- F. the disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning

### Epidemiology

- prevalence in general population: 7%
- men's trauma is most commonly combat experience/physical assault; women's trauma is usually physical or sexual assault

### Treatment

- CBT: exposure therapy, challenge dysfunctional beliefs, emotional regulation techniques (e.g. breathing, relaxation)
- biological
  - SSRIs
  - benzodiazepines (for acute anxiety)
  - adjunctive atypical antipsychotics (risperidone, olanzapine)
- Eye Movement Desensitization and Reprocessing (EMDR): an experimental method of reprocessing memories of distressing events by recounting them while using a form of dual attention stimulation such as eye movements, bilateral sound, or bilateral tactile stimulation (its use is controversial because of limited evidence)

### Complications

- substance abuse, relationship difficulties, depression, impaired social and occupational functioning disorders, Axis II disorders

#### Acute Stress Disorder

May be a precursor to PTSD

##### Criteria:

- Exposure to traumatic event
- Dissociative symptoms
- Event is persistently re-experienced
- Avoidance of stimuli
- Symptoms of anxiety or increased arousal
- Causes clinically significant distress or impairment in social, occupational or other important areas of functioning
- Symptoms last 2 d to 4 wk and occur within 4 wk of event

#### Criteria for Post-Traumatic Stress Disorder

##### TRAUMA

Traumatic event

Re-experience the event

Avoidance of stimuli associated with the trauma

Unable to function

More than a Month

Arousal increased

# Adjustment Disorder

## DSM-IV-TR Diagnostic Criteria for Adjustment Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000).  
American Psychiatric Association.

- A. the development of emotional or behavioural symptoms in response to an identifiable stressor(s) occurring within 3 mo of the onset of the stressor(s)
- B. these symptoms or behaviours are clinically significant as evidenced by either of the following
  - (1) marked distress that is in excess of what would be expected from exposure to the stressor
  - (2) significant impairment in social or occupational (academic) functioning
- C. the stress-related disturbance does not meet criteria for another Axis I disorder and is not merely an exacerbation of a pre-existing Axis I or Axis II disorder
- D. the symptoms do not represent bereavement
- E. once the stressor (or its consequences) has terminated, the symptoms do not persist for more than an additional 6 mo
  - specify if
    - ♦ **acute:** if the disturbance lasts less than 6 mo
    - ♦ **chronic:** if the disturbance lasts for 6 mo or longer
  - adjustment disorders are coded based on the subtype, which is selected according to the predominant symptoms

## Classification

- types of stressors
  - single (e.g. termination of romantic relationship)
  - multiple (e.g. marked business difficulties and marital problems)
  - recurrent (e.g. seasonal business crises)
  - continuous (e.g. living in a crime-ridden neighbourhood)
  - developmental events (e.g. going to school, leaving parental home, getting married, becoming a parent, failing to attain occupational goals, retirement)
  - **Note:** the specific stressor is specified on Axis IV
- **subtypes**, adjustment disorder with:
  - ♦ depressed mood
  - ♦ anxiety
  - ♦ mixed anxiety and depressed mood
  - ♦ disturbance of conduct
  - ♦ mixed disturbance of emotions and conduct
  - ♦ unspecified

## Epidemiology

- M=F

## Treatment

- brief psychotherapy (group, individual), crisis intervention
- biological
  - benzodiazepines may be used for those with anxiety symptoms (short-term, low-dose, regular schedule)
  - SSRIs for both depression and anxiety symptoms

# Bereavement

## Clinical Presentation

- length and characteristics of “normal” bereavement are variable between individuals/cultures
- may present with symptoms of MDE/MDD but individual regards depressed mood as normal
- diagnosis of MDD only given if symptoms persist >2 mo after loss (note – this stipulation has been removed in DSM-5; it is now possible to diagnose MDD regardless of how close it comes to loss)
- presence of following symptoms may indicate abnormal grief/presence of MDD
  - guilt about things other than actions taken or not taken by the survivor at the time of death
  - thoughts of death other than the survivor feeling that they would be better off dead or should have died with the deceased person; morbid preoccupation with worthlessness
  - marked psychomotor retardation; prolonged and marked functional impairment
  - hallucinatory experiences other than thinking that the survivor hears the voice of or transiently sees the image of the deceased person
- prolonged or complicated grief may occur if unable to “move on” or re-engage in life

### Risk Factors for Poor Bereavement Outcome:

- Poor social supports
- Unanticipated death or lack of preparation for death
- Highly dependent relationship with deceased
- High initial distress
- Other concurrent stresses and losses
- Death of a child
- Pre-existing psychiatric disorders, especially depression and separation anxiety

# Cognitive Disorders

## Delirium

- see [Neurology](#), N17 and [Geriatric Medicine](#), GM3

### DSM-IV-TR Diagnostic Criteria for Delirium due to a GMC

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- disturbance of consciousness (i.e. reduced clarity of awareness of the environment) with reduced ability to focus, sustain, or shift attention
- a change in cognition (such as memory deficit, disorientation, language disturbance) or the development of a perceptual disturbance that is not better accounted for by a pre-existing, established, or evolving dementia
- the disturbance develops over a short period of time (usually hours to days) and tends to fluctuate during the course of the day
- there is evidence from the history, physical examination, or laboratory findings that the disturbance is caused by the direct physiological consequences of a GMC

### Clinical Presentation and Assessment

- common symptoms
  - wandering attention
  - distractibility
  - disorientation (time, place, rarely person)
  - misinterpretations, illusions, hallucinations
  - speech/language disturbances (dysarthria, dysnomia, dysgraphia)
  - affective symptoms (anxiety, fear, depression, irritability, anger, euphoria, apathy)
  - shifts in psychomotor activity (groping/picking at clothes, attempts to get out of bed when unsafe, sudden movements, sluggishness, lethargy)
- Folstein Mini Mental Status Exam (see sidebar, PS3) is helpful to assess baseline of altered mental state (i.e. score will improve as symptoms resolve)

### Risk Factors

- hospitalization (incidence 10-40%)
- nursing home residents (incidence 60%)
- childhood (e.g. febrile illness, anticholinergic use)
- old age (especially males)
- severe illness (e.g. cancer, AIDS)
- pre-existing cognitive impairment or brain pathology
- recent anesthesia
- substance abuse

### Etiology

- Infectious (encephalitis, meningitis, UTI, pneumonia)
- Withdrawal (alcohol, barbiturates, benzodiazepines)
- Acute metabolic disorder (electrolyte imbalance, hepatic or renal failure)
- Trauma (head injury, postoperative)
- CNS pathology (stroke, hemorrhage, tumour, seizure disorder, Parkinson's)
- Hypoxia (anemia, cardiac failure, pulmonary embolus)
- Deficiencies (vitamin B<sub>12</sub>, folic acid, thiamine)
- Endocrinopathies (thyroid, glucose, parathyroid, adrenal)
- Acute vascular (shock, vasculitis, hypertensive encephalopathy)
- Toxins: substance use, sedatives, opioids (especially morphine), anesthetics, anticholinergics, anticonvulsants, dopaminergic agents, steroids, insulin, glyburide, antibiotics (especially quinolones), NSAIDs
- Heavy metals (arsenic, lead, mercury)

### Investigations

- standard: CBC and differential, electrolytes, Ca<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>, Mg<sup>2+</sup>, glucose, ESR, LFTs, Cr, BUN, TSH, vitamin B<sub>12</sub>, folate, albumin, urine C&S, R&M
- as indicated: ECG, CXR, CT head, toxicology/heavy metal screen, VDRL, HIV, LP, EEG (typically abnormal: generalized slowing or fast activity), blood cultures
- indications for CT head: focal neurological deficit, acute change in status, anticoagulant use, acute incontinence, gait abnormality, history of cancer

#### Delirium

#### I WATCH DEATH

Infectious

Withdrawal from drugs

Acute metabolic disorder

Trauma

CNS pathology

Hypoxia

Deficiencies in vitamins

Endocrinopathies

Acute vascular insults

Toxins

Heavy metals

## Management

- intrinsic
  - identify and treat underlying cause immediately
  - stop all non-essential medications
  - maintain nutrition, hydration, electrolyte balance and monitor vitals
- extrinsic
  - environment should be quiet and well lit
  - optimize hearing and vision
  - room near nursing station for closer observation; constant care if patient jumping out of bed, pulling out lines
  - family member present for reassurance and re-orientation
  - calendar, clock for orientation cues
- biological
  - low dose antipsychotics
  - haloperidol has the most evidence; reasonable alternatives include risperidone, olanzapine or quetiapine
  - benzodiazepines only to be used in alcohol withdrawal delirium; otherwise, can worsen delirium
- physical restraints if patient becomes violent

## Prognosis

- up to 50% 1 yr mortality rate after episode of delirium

## Dementia

- see [Neurology](#), N17

### DSM-IV-TR Diagnostic Criteria for Dementia (Alzheimer's Type)

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- the development of multiple cognitive deficits manifested by both
  - memory impairment (impaired ability to learn new information or to recall previously learned information)
  - $\geq 1$  of the following cognitive disturbances:
    - ♦ aphasia (language disturbance)
    - ♦ apraxia (impaired ability to carry out motor activities despite intact motor function)
    - ♦ agnosia (failure to recognize or identify objects despite intact sensory function)
    - ♦ disturbance in executive functioning (i.e. planning, organizing, sequencing, abstracting)
- the cognitive deficits in Criteria A1 and A2 each cause significant impairment in social or occupational functioning and represent a significant decline from a previous level of functioning
- the course is characterized by gradual onset and continuing cognitive decline
- the cognitive deficits in Criteria A1 and A2 are not due to any of the following:
  - other central nervous system conditions that cause progressive deficits in memory and cognition
  - systemic conditions that are known to cause dementia
  - substance-induced conditions
- the deficits do not occur exclusively during the course of a delirium
- the disturbance is not better accounted for by another Axis I disorder

## Epidemiology

- prevalence increases with age: 10% in patients >65 yr of age; 25% in patients over 85 yr of age
- prevalence is increased in people with Down's syndrome and head trauma
- Alzheimer's dementia comprises >50% of cases; vascular causes comprise approximately 15% of cases (other causes of dementia – see [Neurology](#), N18)
- average duration of illness from onset of symptoms to death is 8-10 yr

## Subtypes

- with or without behavioural disturbance (e.g. wandering, agitation)
- early onset: age of onset <65 yr
- late onset: age of onset >65 yr

## Investigations (rule out reversible causes)

- standard: see *Delirium*, PS19
- as indicated: VDRL, HIV, SPECT, CT head in dementia
- indications for CT head: same as for delirium, plus: age <60, rapid onset (unexplained decline in cognition or function over 1-2 mo), dementia of relatively short duration (<2 yr), recent significant head trauma, unexplained neurological symptoms (new onset of severe headache/seizures)

### Most Common Types of Dementia

- Alzheimer's dementia
- Vascular dementia
- Lewy-Body dementia
- Fronto-temporal dementia

### The 4 As of Dementia ( $\geq 5$ )

Amnesia  
Aphasia  
Apraxia  
Agnosia

### Risk of Death with Atypical Antipsychotic Drug Treatment for Dementia

JAMA 2005;294:1934-1943

**Purpose:** To assess the evidence for increased mortality from atypical antipsychotic drug treatment for delusions, aggression and agitation in dementia.

**Study Characteristics:** Meta-analysis of 15 RCTs with 5110 patients.

**Participants:** Patients with Alzheimer's disease or dementia.

**Results:** Death occurred more often among patients randomized to drugs (118 [3.5%] vs. 40 [2.3%]). The odds ratio by meta-analysis was 1.54; 95% confidence interval [CI], 1.06-2.23;  $P=0.02$ . Sensitivity analyses did not show evidence for differential risks for individual drugs or diagnosis.

**Conclusions:** Atypical antipsychotic drugs may be associated with a small increased risk of death compared to placebo. This risk should be considered within the context of medical need for the drugs, efficacy evidence, medical comorbidity, and the efficacy and safety of alternatives.

## Management

- see [Neurology](#), N20 for further management
- treat underlying medical problems and prevent others
- provide orientation cues for patient (e.g. clock, calendar)
- provide education and support for patient and family (e.g. day programs, respite care, support groups, home care)
- consider long-term care plan (nursing home) and power of attorney/living will
- inform Ministry of Transportation about patient's inability to drive safely
- consider pharmacological therapy
  - cholinesterase inhibitors [e.g. donepezil (Aricept®)] for mild to severe disease
  - NMDA receptor antagonist (e.g. memantine) for moderate to severe disease
  - low-dose neuroleptics (e.g. risperidone, quetiapine), antidepressants or trazodone if behavioural or emotional symptoms prominent – start low and go slow
  - reassess pharmacological therapy every 3 mo

**Table 4. Comparison of Dementia, Delirium and Pseudodementia of Depression**

	Dementia	Delirium	Pseudodementia of Depression
<b>Onset</b>	Gradual/step-wise decline	Acute (h-d)	Subacute
<b>Duration</b>	Months-years	Days-weeks	Variable
<b>Natural History</b>	Progressive Usually irreversible	Fluctuating, reversible High morbidity/mortality in very old	Recurrent Usually reversible
<b>Level of Consciousness</b>	Normal	Fluctuating (over 24 h)	Normal
<b>Attention</b>	Not initially affected	Decreased (wandering, easy distraction)	Difficulty concentrating
<b>Orientation</b>	Intact initially	Impaired (usually to time and place), fluctuates	Intact
<b>Behaviour</b>	Disinhibition, impairment in ADL/IADL, personality change, loss of social graces	Severe agitation/retardation	Importuning, self-harm/suicide
<b>Psychomotor</b>	Normal	Fluctuates between extremes	Slowing
<b>Sleep Wake Cycle</b>	Fragmented sleep at night	Reversed sleep wake cycle	Early morning awakening
<b>Mood and Affect</b>	Labile but not usually anxious	Anxious, irritable, fluctuating	Depressed, stable
<b>Cognition</b>	Decreased executive functioning, paucity of thought	Fluctuating preceded by mood changes	Fluctuating
<b>Memory Loss</b>	Recent, eventually remote	Marked recent	Recent
<b>Language</b>	Agnosia, aphasia, decreased comprehension, repetition, speech (echolalia, palilalia)	Dysnomia, dysgraphia, speech rambling, irrelevant, incoherent, subject changes	Not affected
<b>Delusions</b>	Compensatory	Nightmarish and poorly formed	Nihilistic, somatic
<b>Hallucinations</b>	Variable	Visual common	Less common, auditory predominates
<b>Quality of Hallucinations</b>	Vacuous/bland	Frightening/bizarre	Self-deprecatory
<b>Medical Status</b>	Variable	Acute illness, drug toxicity	R/O systemic illness, medications

## Substance-Related Disorders

### Epidemiology

- 47% of those with substance abuse have mental health problems
- 29% of those with a mental health disorder have a substance use disorder
- 47% of those with schizophrenia and 25% of those with an anxiety disorder have a substance use disorder

### Types of Substance Use Disorders

1. **substance abuse**: maladaptive pattern of substance use leading to clinically significant impairment or distress, as manifested by  $\geq 1$  of the following occurring within a 12 mo period
  - recurrent use in situations in which it is physically hazardous (e.g. driving)
  - recurrent use resulting in failure to fulfill major role obligation
  - recurrent substance-related legal problems
  - continued use despite interference with social or interpersonal function

#### Substance Abuse

##### HELP

Hazardous  
Education/work/home consequences  
Legal problems  
Personal/social consequences

2. **substance dependence:** maladaptive pattern of substance use leading to clinically significant impairment or distress as manifested by  $\geq 3$  occurring at any time in the same 12 mo period
- tolerance (need for increased amount to achieve intoxication or diminished effect with same amount of substance)
  - withdrawal/use to avoid withdrawal
  - taken in larger amount or over longer period than intended
  - persistent desire or unsuccessful efforts to cut down
  - excessive time to procure, use substance, or recover from its effects
  - important interests/activities given up or reduced
  - continued use despite physical/psychological problem caused/exacerbated by substance
- **Note:** in DSM-5 "Substance Use Disorders" will take the place of distinguishing substance abuse from substance dependence

### Classification of Substances

Depressants	Alcohol, Opioids, Barbiturates, Benzodiazepines, GHB
Stimulants	Amphetamines, Methylphenidate, Cocaine
Hallucinogens	Cannabis, LSD, PCP, Ketamine, Psilocybin

#### Substance Dependence

##### MCAT

More drug needed to achieve intoxication  
Cutting down unsuccessful  
Activities given up or reduced  
Time to procure, use substance, or recover from effects is excessive

## Nicotine

- see [Family Medicine](#), *Smoking Cessation*, FM10

## Alcohol

- see [Family Medicine](#), *Alcohol*, FM12 and [Emergency Medicine](#), ER48

### History

- CAGE: validated screening questionnaire
  - C ever felt the need to Cut down on drinking?
  - A ever felt Annoyed at criticism of your drinking?
  - G ever feel Guilty about your drinking?
  - E ever need a drink first thing in morning (Eye opener)?
    - for men, a score of  $\geq 2$  is a positive screen; for women, a score of  $\geq 1$  is a positive screen
    - if positive CAGE, then assess further to distinguish between problem drinking and alcohol dependence

Make sure to ask about other alcohols: mouthwash, rubbing alcohol, methanol, ethylene glycol, aftershave (may be used as a cheaper alternative)

### General Assessment

- When was your last drink?
- Do you have to drink more to get the same effect?
- Do you get shaky or nauseous when you stop drinking?
- Have you ever had a withdrawal seizure?
- How much time and effort do you put into obtaining alcohol?
- Has your drinking affected your ability to work, go to school, or have relationships?
- Have you suffered any legal consequences?
- Has your drinking caused any medical problems?

#### A "Standard Drink"

Spirit (40%): 1.5 oz. or 43 mL  
Table Wine (12%): 5 oz. or 142 mL  
Fortified Wine (18%): 3 oz. or 85 mL  
Regular Beer (5%): 12 oz. or 341 mL

OR

1 pint of beer = 1.5 SD  
1 bottle of wine = 5 SD  
1 "mickey" = 8 SD  
"26-er" = 17 SD  
"40 oz." = 27 SD

**Table 5. Canada's Low-Risk Alcohol Drinking Guidelines**

Moderate Drinking		
Men: 3 or less/d ( $\leq 15$ /wk)	Women: 2 or less/d ( $\leq 10$ /wk)	Elderly: 1 or less/d

### Alcohol Intoxication

- legal limit for impaired driving is 10.6 mmol/L (50 mg/dL) reached by 2-3 drinks/h for men and 1-2 drinks/h for women
- coma can occur with  $>60$  mmol/L (non-tolerant drinkers) and 90-120 mmol/L (tolerant drinkers)

### Alcohol Withdrawal

- occurs within 12 to 48 h after prolonged heavy drinking and can be life-threatening
- alcohol withdrawal can be described as having 4 stages, however not all stages may be experienced
  - stage 1 (onset 12-18 h after last drink): "the shakes" tremor, sweating, agitation, anorexia, cramps, diarrhea, sleep disturbance
  - stage 2 (onset 7-38 h): alcohol withdrawal seizures, usually tonic-clonic, nonfocal and brief
  - stage 3 (onset 48 h): visual, auditory, olfactory or tactile hallucinations
  - stage 4 (onset 3-5 d): delirium tremens, confusion, delusions, hallucinations, agitation, tremors, autonomic hyperactivity (fever, tachycardia, hypertension)
- course: in young almost completely reversible; elderly often left with cognitive deficits
- mortality rate 20% if untreated

#### Delirium Tremens

(alcohol withdrawal delirium)

- Autonomic hyperactivity (diaphoresis, tachycardia, increased respiration)
- Hand tremor
- Insomnia
- Psychomotor agitation
- Anxiety
- Nausea or vomiting
- Tonic-clonic seizures
- Visual/tactile/auditory hallucinations
- Persecutory delusions

## Management of Alcohol Withdrawal

- monitor using the Clinical Institute Withdrawal Assessment for Alcohol (CIWA-A) scoring system
  - areas of assessment include
    - nausea and vomiting
    - tactile disturbances
    - tremor
    - auditory disturbances
    - agitation
    - paroxysmal sweats
    - visual disturbances
    - anxiety
    - headache, fullness in head
    - orientation and clouding of sensorium
  - all categories are scored from 0-7 (except: orientation/sensorium 0-4), maximum score of 67
    - mild <10
    - moderate 10-20
    - severe >20

### EtOH Metabolism

**Table 6. CIWA-A Scale Treatment Protocol for Alcohol Withdrawal**

<b>Basic Protocol</b>	Diazepam 20 mg PO q1-2h prn until CIWA-A <10 points Observe 1-2 h after last dose and re-assess on CIWA-A scale Thiamine 100 mg IM then 100 mg PO OD for 3 d Supportive care (hydration and nutrition)
<b>History of Withdrawal Seizures</b>	Diazepam 20 mg PO q1h for minimum of three doses regardless of subsequent CIWA scores
<b>If age &gt;65 or patient has severe liver disease, severe asthma or respiratory failure</b>	Use a short acting benzodiazepine Lorazepam PO/SL/IM 1-4 mg q1-2h
<b>If Hallucinations are present</b>	Haloperidol 2-5 mg IM/PO q1-4h – max 5 doses/d or atypical antipsychotics (olanzapine, risperidone) Diazepam 20 mg x 3 doses as seizure prophylaxis (haloperidol lowers seizure threshold)
<b>Admit to Hospital if</b>	Still in withdrawal after >80 mg of diazepam Delirium tremens, recurrent arrhythmias, or multiple seizures Medically ill or unsafe to discharge home

## Wernicke-Korsakoff Syndrome

- alcohol-induced amnesic disorders due to thiamine deficiency
- necrotic lesions: mammillary bodies, thalamus, brainstem
- Wernicke's encephalopathy (acute and reversible): triad of nystagmus (CN VI palsy), ataxia and confusion
- Korsakoff's syndrome (chronic and only 20% reversible with treatment): anterograde amnesia and confabulations; cannot occur during an acute delirium or dementia and must persist beyond usual duration of intoxication/withdrawal
- management
  - Wernicke's: thiamine 100 mg PO OD x 1-2 wk
  - Korsakoff's: thiamine 100 mg PO bid/tid x 3-12 mo

## Treatment of Alcohol Dependence

- non-pharmacological**
  - psychotherapy: motivational enhancement therapy (MET, increasing motivation to change), CBT (assertiveness training, increasing social support, planning leisure activities), marital and family therapy
  - behaviour therapy: contingency management, community reinforcement approach (CRA)
  - supportive services: counseling, detoxification centres, Alcoholics Anonymous
  - inpatient programs (e.g. 28-day programs)
    - individual readiness for change must always be considered with non-pharmacological interventions (refer to Prochaska's Stages of Change Model, [Population Health and Epidemiology](#), PH6)
- pharmacological**
  - naltrexone: opioid antagonist, shown to be successful in reducing the "high" associated with alcohol, moderately effective in reducing cravings, frequency or intensity of alcohol binges
  - disulfiram (Antabuse®): blocks oxidation of alcohol (blocks acetaldehyde dehydrogenase); with alcohol consumption, acetaldehyde accumulates to cause a toxic reaction (vomiting, tachycardia, death); if patient relapses, must wait 48 h before restarting Antabuse®
  - acamprosate (Campral): NMDA glutamate receptor antagonist; useful in maintaining abstinence and decreasing cravings

### Opioid Antagonists: Naltrexone vs. Naloxone

Naltrexone (Revia®)

- Used for opioid and EtOH dependence
- Long half life (h)

Naloxone (Narcan®):

- Used for life-threatening CNS/respiratory depression in opioid overdose
- Short half life (<1 h)
- Very fast acting (min)
- High affinity for opioid receptor
- Induces opioid withdrawal symptoms

## Opioids

- types of opioids: heroin, morphine, oxycodone, Tylenol #3® (codeine), hydromorphone
- major risks associated with the use of contaminated needles: increased risk of hepatitis B and C, bacterial endocarditis, HIV/AIDS

## Acute Intoxication

- direct effect on receptors in CNS resulting in decreased pain perception, sedation, decreased sex drive, nausea/vomiting, decreased GI motility (constipation and anorexia), and respiratory depression

### Toxic Reaction

- typical syndrome includes shallow respirations, miosis, bradycardia, hypothermia, decreased level of consciousness
- management
  - ABCs
  - IV glucose
  - naloxone hydrochloride (Narcan®): 0.4 mg up to 2 mg IV for diagnosis
  - treatment: intubation and mechanical ventilation,  $\pm$  naloxone drip, until patient alert without naloxone (up to 48+ h with long-acting opioids)
- caution with longer half-life; may need to observe for toxic reaction for at least 24 h

### Withdrawal

- symptoms: depression, insomnia, drug-craving, myalgias, nausea, chills, autonomic instability (lacrimation, rhinorrhea, piloerection)
- onset: 6-12 h; duration: 5-10 d
- complications: loss of tolerance (overdose on relapse), miscarriage, premature labour
- management: long-acting oral opioids (methadone, buprenorphine),  $\alpha$ -adrenergic agonists (clonidine)

### Treatment of Chronic Abuse

- psychosocial treatment (e.g. Narcotics Anonymous) usually emphasize total abstinence
- naltrexone or naloxone (opioid antagonists) may also be used to extinguish drug-seeking behaviour
- long-term treatment may include withdrawal maintenance treatment with methadone or buprenorphine
- Suboxone® formulation includes naloxone in addition to buprenorphine, in an effort to prevent injection of the drug. When naloxone is injected, it will precipitate opiate withdrawal and block the opiate effect of buprenorphine, however it will not have this antagonist action when taken sublingually

**Table 7. Comparison of Methadone and Suboxone® (buprenorphine and naloxone)**

	Suboxone®	Methadone
<b>Mechanism of action</b>	Combined formulation of partial opiate agonist and opiate antagonist (which is only active when injected)	Full opiate agonist
<b>Ceiling effect</b>	Yes. This limits the risk of overdose and abuse potential	No. Higher risk of overdose and abuse potential
<b>Half life</b>	36-48 h, dosing can be daily or alternate days	24-36 h, daily dosing
<b>Withdrawal symptoms</b>	Mild	Moderate/severe
<b>Effectiveness</b>	Limited to mild/moderate opioid dependence	More effective for severe opioid dependence
<b>Cost</b>	Expensive	Inexpensive
<b>FDA approval</b>	2002	1947

## Cocaine

- street names: blow, C, coke, crack, flake, freebase, rock, snow
- alkaloid extracted from leaves of the coca plant; blocks presynaptic uptake of dopamine (causing euphoria), norepinephrine and epinephrine (causing vasospasm, hypertension)
- self-administered by inhalation or intravenous route

### Intoxication

- elation, euphoria, pressured speech, restlessness, sympathetic stimulation (e.g. tachycardia, mydriasis, sweating)
- prolonged use may result in paranoia and psychosis

### Overdose

- medical emergency: hypertension, tachycardia, tonic-clonic seizures, dyspnea, and ventricular arrhythmias
- treatment with IV diazepam to control seizures and propranolol or labetalol to manage hypertension and arrhythmias

### Withdrawal

- initial "crash" (1-48 h): increased sleep, increased appetite
- withdrawal (1-10 wk): dysphoric mood plus fatigue, irritability, vivid unpleasant dreams, insomnia or hypersomnia, psychomotor agitation or retardation
- complications: relapse, suicide (significant increase in suicide during withdrawal period)
- management: supportive management

#### Maintenance Medication for Opiate Addiction:

##### The Foundation of Recovery

*J Addict Dis* 2012;31:207-225

**Study:** Review.

**Discussion:** Maintenance treatment of opioid addiction with methadone or buprenorphine is associated with retention in treatment, reduction in illicit opiate use, decreased craving, and improved social function. Recently, studies showing extended release naltrexone injections have showed some promise.

#### OxyNEO vs. OxyContin

As of 2012, OxyContin was no longer available in Canada and was replaced by a new formulation of oxycodone called OxyNEO. OxyNEO is reported to be more tamper-resistant than OxyContin as the tablet is more difficult to crush. Furthermore, if OxyNEO is crushed, and added to water, it forms a thick gel-like substance that cannot be easily injected.

#### Common Presentations of Drug Use

System	Findings
<b>General</b>	Weight loss (especially cocaine, heroin) Injected conjunctiva (cannabis) Pinpoint pupils (opioids) Track marks (injection drugs)
<b>MSK</b>	Trauma
<b>GI</b>	Viral hepatitis (injection drugs) Unexplained elevations in ALT (injection drugs)
<b>Behavioural</b>	Missed appointments Non-compliance Drug-seeking (especially benzodiazepines, opioids)
<b>Psychological</b>	Insomnia Fatigue Depression Flat affect (benzodiazepines, barbiturates) Paranoia (cocaine) Psychosis (cocaine, cannabis, hallucinogens)
<b>Social</b>	Marital discord Family violence Work/school Absenteeism and poor performance

### Treatment of Chronic Abuse

- psychotherapy, group therapy, NA (narcotics anonymous) and behaviour modification useful in maintaining abstinence

### Complications

- cardiovascular: arrhythmias, MI, CVA, ruptured AAA
- neurologic: seizures
- psychiatric: psychosis, paranoia, delirium, suicidal ideation

## Amphetamines

- intoxication characterized by euphoria, improved concentration, sympathetic and behavioural hyperactivity and at high doses can cause coma
- chronic use can produce a paranoid psychosis which can resemble schizophrenia with agitation, paranoia, delusions and hallucinations
- withdrawal symptoms include dysphoria, fatigue, and restlessness
- treatment of stimulant psychosis: antipsychotics

## Cannabis

- cannabis (marijuana) is the most commonly used illicit drug
- psychoactive substance: delta-9-tetrahydrocannabinol ( $\Delta^9$ -THC)
- intoxication characterized by tachycardia, conjunctival vascular engorgement, dry mouth, altered sensorium, increased appetite, increased sense of well-being, euphoria/laughter, muscle relaxation, impaired performance on psychomotor tasks including driving
- high doses can cause depersonalization, paranoia, anxiety and may trigger psychosis and schizophrenia if predisposed
- chronic use associated with tolerance and an apathetic, amotivational state
- cessation does produce a significant withdrawal phenomenon
- treatment of dependence: behavioural and psychological interventions to maintain an abstinent state

## Hallucinogens

- types of hallucinogens: LSD, mescaline, psilocybin mushrooms, PCP, salvia
- LSD is a highly potent drug; intoxication characterized by tachycardia, HTN, mydriasis, tremor, hyperpyrexia, and a variety of perceptual and mood changes
- high doses can cause depersonalization, paranoia, and anxiety
- no specific withdrawal syndrome characterized
- treatment of agitation and psychosis: support, reassurance, diminished stimulation; benzodiazepines or high potency antipsychotics seldom required

## “Club Drugs”

Table 8. The Mechanism and Effects of Common “Club Drugs”

Drug	Mechanism	Effect	Adverse Effects
<b>MDMA</b> (“Ecstasy”, “X”, “E”)	Acts on serotonergic and dopaminergic pathways, properties of a hallucinogen and stimulant	Enhanced sensorium; feelings of well-being, empathy	Sweating, tachycardia fatigue, muscle spasms (especially jaw clenching), ataxia, hyperthermia, arrhythmias, DIC, rhabdomyolysis, renal failure, seizures, death
<b>Gamma Hydroxybutyrate</b> (GHB, “G”, “Liquid Ecstasy”)	Biphasic dopamine response (inhibition then release) and releases opiate-like substance	Euphoric effects, increased aggression, impaired judgment	Sweating, tachycardia, fatigue, muscle spasms (especially jaw clenching), ataxia, severe withdrawal from abrupt cessation of high doses: tremor, seizures, psychosis
<b>Flunitrazepam</b> (Rohypnol®, “Roofies”, “Rope”, “The Forget Pill”)	Potent benzodiazepine, rapid oral absorption	Sedation, psychomotor impairment, amnesic effects, decreased sexual inhibition	CNS depression with EtOH
<b>Ketamine</b> (“Special K”, “Kit-Kat”)	NMDA receptor antagonist, rapid-acting general anesthetic used in pediatrics and by veterinarians	“Dissociative” state, profound amnesia/analgesia; hallucinations and sympathomimetic effects	Psychological distress, accidents due to intensity of experience and lack of bodily control, in overdose, decreased LOC, respiratory depression, catatonia

### Medical Uses of Marijuana

- Anorexia-cachexia (AIDS, cancer)
- Spasticity, muscle spasms (multiple sclerosis, spinal cord injury)
- Levodopa-induced dyskinesia (Parkinson's Disease)
- Controlling tics and obsessive-compulsive behaviour (Tourette's syndrome)
- Reducing intra-ocular pressure (glaucoma)

### Cannabis Use and Risk of Psychotic or Affective Mental Health Outcomes: A Systematic Review

*The Lancet* 2007;370:319-328

**Purpose:** To review the evidence for cannabis use and occurrence of psychotic or affective mental health outcomes.

**Study Characteristics:** A meta-analysis of 35 population-based longitudinal studies, or case-control studies nested within longitudinal designs.

**Results:** There was an increased risk of any psychotic outcome in individuals who had ever used cannabis (pooled adjusted odds ratio = 1.41, 95% CI 1.20-1.65). Findings were consistent with a dose-response effect, with greater risk in people who used cannabis more frequently (2.09, 95% CI, 1.54-2.84). Findings for depression, suicidal thoughts and anxiety outcomes were less consistent. In both cases (psychotic and affective outcomes) a substantial confounding effect was present.

**Conclusions:** The findings are consistent with the view that cannabis increases risk of psychotic outcomes independent of transient intoxication effects, although evidence is less strong for affective outcomes. Although cannabis use and the development of psychosis are strongly associated, it is difficult to determine causality and it is possible that the association results from confounding factors or bias. The authors did conclude that there is sufficient evidence to warn young people that using cannabis could increase their risk of developing a psychotic illness later in life.

### Date Rape Drugs

- GHB
- Flunitrazepam (Rohypnol®)
- Ketamine

### Formication

Tactile hallucination that insects or snakes are crawling over or under the skin. Especially associated with crystal meth use.

### Pharm Party

An increasing trend among teenagers where assorted prescription medications are brought to a party and ingested at random.

**Table 8. The Mechanism and Effects of Common “Club Drugs” (continued)**

Drug	Mechanism	Effect	Adverse Effects
<b>Methamphetamine</b> ("speed", "meth", "chalk", "ice", "crystal")	Amphetamine stimulant, induces norepinephrine, dopamine and serotonin release	Rush begins in min, effects last 6-8 h, increased activity, decreased appetite, general sense of well-being, tolerance occurs quickly, users often binge and crash	Short term use: high agitation, rage, violent behaviour, occasionally hyperthermia and convulsions Long term use: addiction, anxiety, confusion, insomnia, paranoia, auditory and tactile hallucinations (esp. formication), delusions, mood disturbance, suicidal and homicidal thoughts, stroke, may be contaminated with lead, and IV users may present with acute lead poisoning
<b>Phencyclidine</b> ("PCP", "angel dust")	Not understood, used by veterinarians to immobilize large animals	Amnestic, euphoric, hallucinatory state	Horizontal/vertical nystagmus, myoclonus, ataxia, autonomic instability (treat with diazepam IV), prolonged agitated psychosis (treat with haloperidol); high risk for suicide; violence towards others High dose can cause coma

## Somatoform Disorders

### General Characteristics

- physical signs and symptoms lacking a known medical basis in the presence of psychological factors that are judged to be important in the initiation, exacerbation, or maintenance of the disturbance
- cause significant distress or impairment in functioning
- symptoms are produced unconsciously and are not the result of malingering or factitious disorder
- primary gain: somatic symptom represents a symbolic resolution of an unconscious psychological conflict; serves to reduce anxiety and conflict; no external incentive
- secondary gain: the sick role; external benefits obtained or unpleasant duties avoided (e.g. work)

### Management of Somatoform Disorders

- brief frequent visits
- limit number of physicians involved in care
- focus on psychosocial not physical symptoms
- minimize medical investigations; coordinate necessary investigations
- psychotherapy: CBT, biofeedback, conflict resolution
- minimize psychotropic drugs: anxiolytics in short term only, antidepressants for depressive symptoms

- **Note:** significant changes in DSM-5

**Malingering:** intentional production of false or grossly exaggerated physical or psychological symptoms, motivated by external reward (e.g. avoiding work, obtaining financial compensation or obtaining drugs).

**Factitious disorder:** intentional production or feigning of physical or psychological signs or symptoms in order to assume the sick role where external incentives (e.g. economic gain) are absent.

## Body Dysmorphic Disorder

- preoccupation with imagined defect in appearance or excess concern around a slight anomaly
- usually related to the face
- M=F, prevalence 1-2.2% in the community; 6-15% in dermatology/cosmetic surgery clinics
- may lead to avoidance of work or social situations

## Conversion Disorder

- one or more symptoms or deficits affecting voluntary motor or sensory function that mimic a neurological or GMC (e.g. impaired co-ordination, local paralysis, double vision, seizures or convulsions)
- psychological factors thought to be etiologically related to the symptoms as the initiation of symptoms is preceded by conflicts or other stressors
- 11-300/100,000 in general population; focus of treatment in 1-3% of outpatient referrals to mental health clinics
- more common in rural populations and in individuals with little medical knowledge
- spontaneous remission in 95% of acute cases, 50% of chronic cases (>6 mo)

## Hypochondriasis

- preoccupation with fear of having, or the idea that one has, a serious disease based on a misinterpretation of one or more bodily signs or symptoms
- evidence does not support diagnosis of a physical disorder
- fear of having a disease despite medical reassurance
- belief is not of delusional intensity (as in delusional disorder, somatic type) as person acknowledges unrealistic interpretation
- duration is  $\geq 6$  mo; onset in 3rd-4th decade of life
- community prevalence 1.1-4.5%; prevalence in general medical practice 4-9%; higher in psychiatric settings

## Pain Disorder

- pain is primary symptom and is of sufficient severity to warrant medical attention
- usually no organic pathology but when it exists, reaction is excessive
- lifetime prevalence 12%
- psychiatric disorders (mood, anxiety, substance) may precede, co-exist or result from pain disorder

## Somatization Disorder

- recurring, multiple, clinically significant physical complaints which result in patient seeking treatment or having impaired functioning
- $\geq 8$  physical symptoms that have no organic pathology including each of:
  - four pain symptoms related to at least four different sites or functions
  - two gastrointestinal symptoms, not including pain
  - one sexual symptom, not including pain
  - one pseudo-neurological symptom, not including pain (e.g. numbness, paresthesia)
- onset before age 30; extends over a period of years
- lifetime prevalence 0.2-2% among women and 0.2% among men
- cultural factors may influence sex ratio
- complications: anxiety, depression, unnecessary medications or surgery
- often a misdiagnosis for an insidious illness so rule out all organic illnesses (e.g. multiple sclerosis)

## Dissociative Disorders

### Definition

- dissociation so severe that the usually integrated functions of consciousness and perception of self break down
- sudden or gradual onset, transient or chronic course
- symptoms cause distress or impaired functioning
- differential diagnosis: PTSD, acute stress disorder, somatization disorder, substance abuse, GMC (e.g. complex/partial seizures)

**Table 9. Dissociative Disorders**

	Amnesia	Fugue	Identity Disorder	Depersonalization Disorder
<b>Diagnosis</b>	Inability to recall important personal information, usually of a traumatic or stressful nature; may be localized, selective or generalized	Sudden, unexpected travel away from home or workplace with inability to recall some or all of one's past; may assume new identity	Two or more distinct personalities that take control of an individual's behaviour; amnesia regarding personal history (aka Multiple Personality Disorder)	Persistent or recurrent experiences of feeling detached from one's mental processes or body (i.e. like being in a dream)
<b>Epidemiology</b>	6% prevalence Increased in survivors of trauma (war, abuse)	0.2% prevalence May occur under traumatic circumstances (combat, rape, natural disasters)	1.3% prevalence, M:F=1.3:9 May have history of physical or sexual abuse	Rare disorder Approximately 50% of adults have experienced a single brief episode of depersonalization, precipitated by extreme stress
<b>Treatment</b>	Psychotherapy, hypnosis No proven role for barbiturates/ pharmacologically-assisted interviewing	Usually spontaneous recovery Psychotherapy, hypnosis Ensure stability and safety No proven role for barbiturates/ pharmacologically-assisted interviewing	Three stages: symptom stabilization, attention to trauma, reintegration Psychotherapy, hypnosis Symptom-oriented adjuvants (antidepressants, anxiolytics) No proven role for barbiturates/ pharmacologically-assisted interviewing	Psychotherapy Pharmacotherapy: clonazepam, fluoxetine, clomipramine

## Sleep Disorders

- see [Neurology](#), N42

### Criteria for Diagnosis

- causes significant distress or impairment in functioning
- not due to medications, drugs, or a GMC

## Nocturnal Myoclonus

- middle-aged and elderly
- myoclonic jerks every 20-40 s
- bed partner complaints
- treatment: benzodiazepines (clonazepam, nitrazepam)

## Narcolepsy

- see [Neurology](#), N42

## Primary Insomnia

- see [Family Medicine](#), FM48

## Sleep Apnea

- see [Respirology](#), R31

## Sexuality and Gender

### Gender Dysphoria

- gender identity is set at approximately 3 yr of age
- **typical presentation**
  - strong and persistent cross-gender identification
  - repeated stated desire or insistence that one is of the opposite sex
  - preference for cross-dressing, cross-gender roles in make-believe play
  - intense desire to participate in the stereotypical games and pastimes of the opposite sex
  - strong preference for playmates of the opposite sex
  - significant distress or impairment in functioning and persistent discomfort with his or her sex or gender role
- **treatment**
  - psychotherapy
  - hormonal therapy
  - sexual reassignment surgery

## Paraphilias

- **definition:** recurrent, intense sexual arousal, fantasies, sexual urges or behaviour involving non-human objects, suffering or humiliation of oneself or one's partner, children or other non-consenting person causing significant distress or impairment in social, occupational or other areas of functioning
- **subtypes:** exhibitionism, fetishism, frotteurism, voyeurism, pedophilia, sexual masochism, sexual sadism, transvestite fetishism, paraphilia NOS
- rarely self-referred; come to medical attention through interpersonal or legal conflict
- person usually has more than one paraphilia; 5% of paraphilias attributed to women
- **typical presentation**
  - begins in childhood or early adolescence; increasing in complexity and stability with age
  - chronic, decreases with advancing age but may increase with stress
- **treatment**
  - anti-androgen drugs
  - behaviour modification
  - psychotherapy

### SEXUAL DYSFUNCTION

- see [Gynecology](#), GY31 and [Urology](#), U30

# Eating Disorders

## Epidemiology

- anorexia nervosa (AN): 1% of adolescent and young adult females; onset 13-20 yr old
- bulimia nervosa (BN): 2-4% of adolescent and young adult females; onset 16-18 yr old
- F:M=10:1; mortality 5-10%

## Etiology

- multifactorial: psychological, sociological and biological associations
- individual: perfectionism, lack of control in other life areas, history of sexual abuse
- personality: obsessive-compulsive, histrionic, borderline
- familial: maintenance of equilibrium in dysfunctional family
- cultural factors: prevalent in industrialized societies, idealization of thinness in the media
- genetic factors
  - AN: 6% prevalence in siblings, with one study of twin pairs finding concordance in 9 of 12 monozygotic pairs versus concordance in 1 of 14 dizygotic pairs
  - BN: higher familial incidence of affective disorders than the general population

## Risk Factors

- physical factors: obesity, chronic medical illness (e.g. diabetes mellitus)
- psychological factors: individuals who by career choice are expected to be thin, family history (mood disorders, eating disorders, substance abuse), history of sexual abuse, homosexual males, competitive athletes, concurrent associated mental illness [depression, OCD, anxiety disorder (especially panic and agoraphobia), substance abuse (specifically for BN)]

# Anorexia Nervosa

## DSM-IV-TR Diagnostic Criteria for Anorexia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- refusal to maintain body weight at or above a minimally normal weight for age and height (e.g. weight loss leading to maintenance of body weight less than 85% of that expected; or failure to make expected weight gain during period of growth, leading to body weight less than 85% of that expected)
- intense fear of gaining weight or becoming fat, even though underweight
- disturbance in the way in which one's body weight or shape is experienced, undue influence of body weight or shape on self-evaluation, or denial of the seriousness of the current low body weight
- in postmenarcheal females, amenorrhea, i.e. the absence of at least three consecutive menstrual cycles (note: this criterion has been removed in DSM-5)

## Specific Type

- **restricting**: during the current episode of AN, the person has not regularly engaged in binge-eating or purging behaviour
- **binge-eating/purging**: during the current episode of AN, the person has regularly engaged in binge-eating or purging behavior

## Management

- outpatient programs and inpatient programs are available
- inpatient hospitalization for treatment of eating disorders is rarely on an acute basis (unless there is a concurrent psychiatric reason for emergent admission e.g. suicide risk)
- admit to a medical ward for hospitalization: <65% of standard body weight (<85% of standard body weight for adolescents), hypovolemia requiring intravenous fluid, heart rate <40 bpm, abnormal serum chemistry or if actively suicidal
- agree on target body weight on admission and reassure this weight will not be surpassed
- psychotherapy (individual/group/family): addressing food and body perception, coping mechanisms, health effects
- monitor for complications of AN (see Table 10)
- monitor for refeeding syndrome:
  - a potentially life-threatening metabolic response to refeeding in severely malnourished patients resulting in severe shifts in fluid and electrolyte levels
  - complications include hypophosphatemia, congestive heart failure, cardiac arrhythmias, delirium and death
  - prevention: slow refeeding, gradual increase in nutrition, supplemental phosphorus, close monitoring of electrolytes and cardiac status

### Athletic Triad

- Disordered eating
- Amenorrhea
- Osteoporosis

### Screening Question for Purging Behaviours

"To lose weight, some people will use laxatives or vomit, have you ever tried that or used other ways to lose weight?"

Some diabetics may use insulin to lose weight, be aware of this in Type 1 DM.

### Prognosis

- early intervention much more effective
- with treatment, 70% resume a weight of at least 85% of expected levels and about 50% resume normal menstrual function
- eating peculiarities and associated psychiatric symptoms are common and persistent
- long-term mortality: 10% to 20% of patients hospitalized will die in next 10 to 30 yr (secondary to severe and chronic starvation, metabolic or cardiac catastrophes, with a significant proportion committing suicide)

## Bulimia Nervosa

### DSM-IV-TR Diagnostic Criteria for Bulimia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, Text Revision, Fourth Edition, (Copyright 2000). American Psychiatric Association.

- recurrent episodes of binge eating. An episode of binge eating is characterized by both of the following
  1. eating, in a discrete period of time, an amount of food that is larger than most people would eat during a similar period of time and under similar circumstances
  2. a sense of lack of control over eating during the episode (e.g. a feeling that one cannot stop eating or control what or how much one is eating)
- recurrent inappropriate compensatory behaviour in order to prevent weight gain, such as self-induced vomiting, misuse of laxatives, diuretics, enemas, or other medications, fasting, or excessive exercise
- the binge eating and inappropriate compensatory behaviours both occur, on average, at least twice a week for 3 mo
- self-evaluation is unduly influenced by body shape and weight
- the disturbance does not occur exclusively during episodes of AN

#### Ipecac Syrup

- Was commonly used to induce vomiting in accidental poisoning or drug overdose
- Used chronically by some patients with EDs to induce vomiting

### Specific Type

- **purging:** during the current episode of BN, the person has regularly engaged in self-induced vomiting or the misuse of laxatives, diuretics, or enemas
- **non-purging:** during the current episode of BM, the person has used other inappropriate compensatory behaviours, such as fasting or excessive exercise, but has not regularly engaged in purging behaviours

### Associated Features

- fatigue and muscle weakness due to repetitive vomiting and fluid/electrolyte imbalance
- tooth decay
- swollen appearance around angle of jaw and puffiness of eye sockets due to fluid retention
- reddened knuckles, Russell's sign (knuckle callus from self-induced vomiting)
- trouble concentrating
- weight fluctuation over time

### Management

- admission for significant electrolyte abnormalities
- biological: treatment of starvation effects, SSRIs
- psychological: develop trusting relationship with therapist to explore personal etiology and triggers, CBT, family therapy, recognition of health risks
- social: challenge destructive societal views of women, use of hospital environment to provide external patterning for normative eating behaviour

### Prognosis

- few recover without recurrence
- good prognostic factors: onset before age 15, achieving a healthy weight within 2 yr of treatment
- poor prognostic factors: later age of onset, previous hospitalizations, individual and familial disturbance

**Table 10. Physiologic Complications of Eating Disorders**

System	Starvation/Restriction	Binge-Purge
General	Low BP, low HR, significant orthostatic changes ± syncopal episodes, low temperature, vitamin deficiencies	Russell's sign (knuckle callus) Parotid gland enlargement Perioral skin irritation Periocular and palatal petechiae Loss of dental enamel and caries Aspiration pneumonia Metabolic alkalosis secondary to hypokalemia and loss of acid
Endocrine	Primary or secondary amenorrhea, decreased $T_3/T_4$	
Neurologic	Grand mal seizure (decreased $Ca^{2+}$ , $Mg^{2+}$ , $PO_4^{3-}$ )	

**Table 10. Physiologic Complications of Eating Disorders** (continued)

System	Starvation/Restriction	Binge-Purge
<b>Cutaneous</b>	Dry skin, lanugo hair, hair loss or thinning, brittle nails, yellow skin from high carotene	
<b>GI</b>	Constipation, GERD, delayed gastric emptying	Acute gastric dilation/rupture, pancreatitis, GERD, hematemesis secondary to Mallory-Weiss tear
<b>CVS</b>	Arrhythmias, CHF	Arrhythmias, cardiomyopathy (from use of ipecac), sudden cardiac death (decreased K <sup>+</sup> )
<b>MSK</b>	Osteoporosis secondary to hypogonadism	Muscle wasting
<b>Renal</b>	Pre-renal failure (hypovolemia), renal calculi	Renal failure (electrolyte disturbances)
<b>Extremities</b>	Pedal edema (decreased albumin)	Pedal edema (decreased albumin)
<b>Lab Values</b>	Starvation: decreased RBCs, decreased WBCs, decreased LH, decreased FSH, decreased estrogen, decreased testosterone, increased growth hormone, increased cholesterol Dehydration: increased BUN	Vomiting: decreased Na <sup>+</sup> , decreased K <sup>+</sup> , decreased Cl <sup>-</sup> , decreased H <sup>+</sup> , increased amylase; hypokalemia with metabolic alkalosis Laxatives: decreased Na <sup>+</sup> , decreased K <sup>+</sup> , decreased Cl <sup>-</sup> , increased H <sup>+</sup> ; metabolic acidosis

**Borderline Personality Disorder****DESPAIRER**

Disturbance of identity  
Emotionally labile  
Suicidal behavior  
Paranoia or dissociation  
Abandonment (fear of)  
Impulsive  
Relationships unstable  
Emptiness (feelings of)  
Rage (inappropriate)

\*Created by Jason Caplan, MD

**Antisocial Personality Disorder****CORRUPT**

Cannot conform to law  
Obligations ignored  
Reckless disregard for safety  
Remorselessness  
Underhanded (deceitful)  
Planning insufficient (impulsive)  
Temper (irritable and aggressive)

## Personality Disorders

**General Diagnostic Criteria**

- an enduring pattern of inner experience and behaviour that deviates markedly from the expectations of the individual's culture; manifested in two or more of: cognition, affect, interpersonal functioning, impulse control
- inflexible and pervasive across a range of situations
- causes distress or impaired functioning not necessarily for the person with the personality disorder (PD), but for those around him/her
- pattern is stable and well established by adolescence or early adulthood
- associated with many complications, such as depression, suicide, violence, brief psychotic episodes, multiple drug use and treatment resistance
- each PD is present in 1% of the population and are lifelong and chronic
- the mainstay of treatment is psychotherapy with the addition of pharmacotherapy to treat associated axis I disorders (i.e. depression, anxiety, substance abuse)
- main treatment for borderline personality disorder is dialectical behavioural therapy (consists of validating rather than blaming the patient, and replacing maladaptive behaviour with adaptive behaviour)

**Table 11. Classification and Diagnosis of Personality Disorders**

**Note:** For each personality disorder, the most recognizable feature is indicated in *italics*

Diagnostic Cluster	Diagnosis
<b>Cluster A "Mad"</b> Patients seem odd, eccentric, withdrawn Familial association with psychotic disorders Common defense mechanisms: intellectualization, projection, magical thinking	<b>Paranoid Personality Disorder (0.5-3%)*</b> <i>Pervasive distrust and suspiciousness of others, interpret motives as malevolent</i> Blame problems on others and seem angry and hostile Diagnosis requires 4 of: 1. Suspicious that others are exploiting or deceiving them 2. Pre-occupied with trustworthiness of acquaintances 3. Reluctant to confide in others 4. Interpret benign remarks as threatening, demeaning 5. Holds grudges 6. Perceives attacks on character and is quick to counterattack 7. Questions fidelity of partner without justification
	<b>Schizotypal Personality Disorder (3-5.6%)</b> <i>Pattern of eccentric behaviours, peculiar thought patterns</i> Diagnosis requires 5 of: 1. Ideas of reference 2. Odd beliefs, magical thinking (inconsistent with cultural norms e.g. belief in telepathy, superstitions) 3. Unusual perceptual experiences (e.g. bodily illusions) 4. Suspiciousness 5. Inappropriate or restricted affect 6. Odd, eccentric appearance or behaviour (e.g. involved in cults, strange religious practices) 7. Few close friends 8. Odd thinking, odd speech (e.g. vague, stereotyped) 9. Excessive social anxiety
	<b>Schizoid Personality Disorder*</b> <i>Neither desires nor enjoys close relationships including being a part of a family; prefers to be alone.</i> <i>Lifelong pattern of social withdrawal</i> <i>Seen as eccentric and reclusive with restricted affect</i> Diagnosis requires 4 of: 1. Does not enjoy or desire close relationships 2. Chooses solitary activities 3. Little to no interest in sexual activity with others 4. Takes pleasure in few (if any) activities 5. Few or no close friends 6. Indifference to praise or criticism 7. Emotionally cold, detached, or has flattened affect

**Table 11. Classification and Diagnosis of Personality Disorders** (continued)

Diagnostic Cluster	Diagnosis	
<b>Cluster B “Bad”</b> Patients seem dramatic, emotional, inconsistent Familial association with mood disorders Common defense mechanisms: denial, acting out, regression (histrionic PD), splitting (borderline PD), projective identification, idealization/devaluation	<b>Borderline Personality Disorder (2-4%)</b> <i>Unstable moods and behaviour, feel alone in the world, problems with self image</i> <i>History of repeated suicide attempts, self-harm behaviours</i> <i>**10% suicide rate**</i> Diagnosis requires 5 of: 1. Frantic efforts to avoid real or imagined abandonment 2. Unstable and intense relationships 3. Unstable sense of self 4. Impulsivity in two potentially harmful ways (sexual, drugs, spending) 5. Recurrent suicidal behaviour/self-harm 6. Unstable mood/affect 7. General feelings of emptiness 8. Difficulty controlling anger 9. Transient dissociative symptoms or paranoid ideation associated with stress	<b>Narcissistic Personality Disorder (2%)</b> <i>Sense of superiority, needs constant admiration, lacks empathy, but with fragile sense of self</i> <i>Consider themselves “special” and will exploit others for personal gain</i> Diagnosis requires 5 of: 1. Exaggerated sense of self-importance (grandiosity) 2. Preoccupied with fantasies of unlimited success, power, beauty, love 3. Believes he/she is “special” and should associate with other “special” people 4. Requires excessive admiration 5. Sense of entitlement 6. Takes advantage of others 7. Lacks empathy 8. Envious of others or believes that others are envious of him/her 9. Arrogant attitudes
	<b>Antisocial Personality Disorder (M: 3%, F: 1%)</b> <i>Lack of remorse for actions, manipulative and deceitful, often violate the law. May appear charming on first impression</i> <i>Pattern of disregard for others and violation of rights of others must be present before the age of 15, however, for the diagnosis of ASPD patients must be at least 18</i> Diagnosis requires 3 of the following: 1. Failure to conform to social norms by committing unlawful acts 2. Deceitfulness, lying, manipulating others for personal gain 3. Impulsive, fails to plan ahead 4. Irritable, aggressive, repeated fights or assaults 5. Recklessness and disregard for personal safety, safety of others 6. Irresponsible, cannot sustain work 7. Lack of remorse for actions	<b>Histrionic Personality Disorder (1.3-3%)*</b> <i>Attention-seeking behaviour and excessively emotional. Are dramatic, flamboyant and extroverted. Cannot form meaningful relationships. Often sexually inappropriate</i> Diagnosis requires 5 of: 1. Not comfortable unless centre of attention 2. Inappropriately sexually seductive 3. Uses physical appearance to attract attention 4. Speech is impressionistic, lacks detail 5. Theatrical and exaggerated expression of emotion 6. Easily influenced by others 7. Perceives relationships as more intimate than they actually are
<b>Cluster C “Sad”</b> Patients seem anxious, fearful Familial association with anxiety disorder Common defense mechanisms: isolation, avoidance, hypochondriasis	<b>Avoidant Personality Disorder (0.5-1.6%)</b> <i>Timid and socially awkward with a pervasive sense of inadequacy and fear of criticism</i> <i>Fear of embarrassing or humiliating themselves in social situations so remain withdrawn and socially inhibited</i> Diagnosis requires 4 of: 1. Avoids occupational activities that involve significant interpersonal contact for fear of criticism or rejection 2. Unwilling to get involved with people unless certain of being liked 3. Restrained in intimate relationships for fear of being shamed or ridiculed 4. Preoccupied with being rejected or criticized in social situations 5. Inhibited in new interpersonal situations due to fear of inadequacy 6. Views him or herself as inferior, socially inept or personally unappealing 7. Reluctant to engage in new activities for fear of embarrassment	<b>Obsessive-Compulsive Personality Disorder (3-10%)</b> <i>Preoccupation with orderliness, perfectionism, and mental and interpersonal control</i> <i>Is inflexible, closed-off, and inefficient</i> Diagnosis requires 4 of: 1. Preoccupation with details, rules, lists, order, organization, or schedules to the extent that the point of an activity is lost 2. Perfectionism interferes with task completion 3. Excessively devoted to work to the exclusion of leisure activities and friendships 4. Inflexible about morality/ethics/values 5. Unable to discard worthless objects of no sentimental value 6. Reluctant to delegate tasks to others 7. Miserly spending style (money is hoarded for future disasters) 8. Rigid and stubborn
	<b>Dependent Personality Disorder (1.6-6.7%)*</b> <i>Pervasive and excessive need to be taken care of, excessive fear of separation, clinging and submissive behaviours</i> <i>Difficulty making everyday decisions</i> Diagnosis requires 5 of: 1. Difficulty making everyday decisions without advice and reassurance from others 2. Needs others to assume responsibility for most major areas of his/her life 3. Difficulty expressing disagreement 4. Difficulty initiating projects due to lack of self-confidence 5. Goes to excessive lengths to obtain support 6. Uncomfortable or helpless when alone because of fear of being unable to take care of him/herself 7. Urgently seeks another relationship as a source of care and support when a close relationship ends 8. Unrealistically preoccupied with fears of being left to take care of him/herself	

**OCPD vs. OCD**

	OCPD	OCD
<b>Ego-syntonic or ego-dystonic</b>	Ego-syntonic	Ego-dystonic
<b>Thought content</b>	Obsessional thinking, no compulsions, strict routine and rigidity in day-to-day matters	Obsessions and compulsions, rituals

\*DSM-V HAS PROPOSED CHANGES TO THESE PERSONALITY DISORDERS

Table 12. Key Differences between Schizoid, Schizotypal and Schizophrenia

	Schizoid	Schizotypal	Schizophrenia
<b>Thought form</b>	Organized	Organized, but vague and circumstantial	Disorganized, tangential, loosening of associations
<b>Thought content</b>	No psychosis	No psychosis, may have ideas of reference, paranoid ideation, odd beliefs and magical thinking	Psychosis, hallucinations
<b>Relationships</b>	Solitary, NO desire for social relationships	Lacks close relationships, INTERESTED in relationships but socially inept	Socially marginalized, but not by choice

### Obsessive-Compulsive Personality Disorder

#### SCRIMPER

Stubborn  
Cannot discard worthless objects  
Rule obsessed  
Inflexible  
Miserly  
Perfectionistic  
Excludes leisure due to devotion to work  
Reluctant to delegate to others

\*Created by Jason Caplan, MD

### Dependent Personality Disorder

#### RELiance

Reassurance required  
Expressing disagreement difficult  
Life responsibilities assumed by others  
Initiating projects difficult  
Alone (feels helpless and uncomfortable when alone)  
Nurturance (goes to excessive lengths to obtain)  
Companionship sought urgently  
Exaggerated fears of being left to care for self

Consider speaking to children alone.  
Always consider child abuse. See [Pediatrics](#), P14.

### Tips for the Child Interview:

- Use language the child will understand (i.e. don't ask about feeling of worthlessness, ask about whether they feel like they're a bad kid)
- Children in some cultures are taught to be quiet and avoid eye contact with adults who are authority figures (do not mistake with depression)
- Use developmentally-appropriate questions (i.e. don't ask about lack of interest in activities, ask children whether they feel bored)

### HEADSSS Interview

Home environment  
Education/Employment  
Activities  
Drugs/Diet  
Sex  
Safety  
Suicide/depression

Attachment type can be assessed in infants 10-18 mo of age using the Strange Situation test, in which the child is stressed by the caregiver being removed from the situation and the stranger staying. Attachment style is measured by the child's behaviour during the reunion with the caregiver.

Attachment problems may present as a child who is difficult to soothe, has difficulty sleeping, problems feeding, tantrums or behaviours.

## Child Psychiatry

### The Child Psychiatric Interview

- **ID**
  - name, age, school grade, living situation, family situation (all family members, age and occupation of parents), demographics
- **Chief Complaint**
  - onset, time course, stressors, impact on child's and family's functioning, supports
  - child's functioning and behaviour at home, at school, and with peers
  - mental status (see MSE, PS3)
- **History of Present Illness**
  - symptoms and features of most likely diagnostic area [e.g. disruptive behaviour disorders (ADHD, CD, ODD), developmental disorders, learning disorders, abuse, mood disorders, and anxiety disorders]
  - in adolescents, consider psychotic disorders, eating disorders, and substance abuse disorders
  - screen for comorbid conditions
  - what was the child like before and after the symptoms? what has changed? what is happening now?
- **Additional History**
  - past history: pregnancy, neonatal, developmental, temperamental, medical, surgical
  - psych history: past assessments (e.g. psychiatric, psychological, educational), treatments
  - family history: similar symptoms, medical, developmental, and psychosocial issues
- **Risk Assessment**
  - physical/sexual abuse, suicidality, aggression/homicidality, firesetting, risky behaviour
  - past risk issues (past suicide attempts, past aggression), previous contact with child protection services
  - brief developmental history: pregnancy, birth, milestones, general behaviour, parents' method of discipline, school functioning, peer relationships

### Developmental Concepts

- **temperament**: innate psycho-physiological and behavioural characteristics of a child (e.g. emotionality, activity, and sociability); spectrum from "difficult" to "slow-to-warm-up" to "easy temperament", plotted on nine parameters:
  - activity level, adaptation, attention span and persistence, distractibility, intensity of reaction, quality of mood, response to a new stimulus, rhythmicity, threshold of responsiveness
- **parental fit**: the congruence between parenting style (authoritative, authoritarian, permissive) and child's temperament
- **attachment**: special relationship between child and primary caretaker(s); develops during first year, best predictor of a child's attachment style is their parent's attachment style (see Table 13)
- **stranger anxiety** (8 mo): infants cry at approach of stranger
- **separation anxiety** (10-18 mo): separation from attachment figure results in distress

Table 13. Attachment Models

Parent/Caregiver	Attachment Type	Features in Child
Loving, consistently available, sensitive, and receptive	Secure	Able to use caregiver to calm self
Rejecting, unavailable psychologically, insensitive responses	Insecure (avoidant)	Not reliant on caregiver for soothing
Inconsistent, insensitive responses, role reversal	Insecure (ambivalent/resistant)	
Frightening, dissociated, sexualized, or atypical	Disorganized	

## Mood Disorders

### MAJOR DEPRESSIVE DISORDER (MDD)

#### Epidemiology

- pre-pubertal 1-2% (no gender differences); post-pubertal 4-18% (F:M = 2:1)

#### Clinical Presentation

- see *Adult Mood Disorders*, PS9
- physical factors: insomnia (children), hypersomnia (adolescents), somatic complaints, substance abuse
- psychological factors: irritability, boredom, anhedonia, low self-esteem, deterioration in academic performance, social withdrawal, lack of motivation
- comorbid diagnoses of anxiety, ADHD, conduct disorder, and eating disorders

#### Treatment

- majority never seek treatment
- individual (CBT, IPT)/family therapy and education, modified school program
- SSRIs (strongest evidence for fluoxetine)
- ECT: only in adolescents
- light therapy, self-help books

#### Prognosis

- prolonged episodes, up to 1-2 yr
- adolescent onset predicts chronic mood disorder; up to 2/3 will have another depressive episode within 5 yr
- complications
  - negative impact on family and peer relationships
  - school failure
  - significantly increased risk of suicide attempt (10%) or completion
  - substance abuse

Irritable mood is a diagnostic feature unique to children and adolescents.

### BIPOLAR DISORDER

#### Clinical Presentation

- see *Adult Bipolar Disorder/Mania*, PS12
- mixed presentation and psychotic symptoms (hallucinations and delusions) more common in adolescent population than adult population
- unipolar depression may be an early sign of adult bipolar disorder
  - ~30% of psychotic depressed adolescents receive a bipolar diagnosis within 2 yr of presentation
  - associated with rapid onset of depression, psychomotor retardation, mood-congruent psychosis, affective illness in family, pharmacologically induced mania

#### Treatment

- 1st line: mood stabilizers and/or antipsychotics
- 2nd line: antidepressants, benzodiazepines (careful of disinhibiting effect)

- Health Canada advises Canadians under the age of 18 to consult physicians if they are being treated with SSRIs, SNRIs or mirtazapine. This request was made as a result of international reports that some of these drugs may be associated with an increased risk of suicidal ideation in patients under the age of 18. There was no increased risk of suicide completion
- FDA advises that the use of SSRIs in youth <24 yr old associated with increased suicidal ideation. No studies show association to completed suicide

**Fluoxetine, Cognitive-Behavioral Therapy and Their Combination for Adolescents with Depression: Treatment for Adolescents with Depression Study (TADS) Randomized Controlled Trial**

JAMA 2004;292:807-820

**Study:** Randomized controlled trial at 13 US academic and community clinics between spring 2000-summer 2003.

**Patients:** 439 patients ages 12-17 with a primary DSM IV diagnosis of major depressive disorder.

**Outcomes:** Children's Depression Rating Scale-Revised (CDRSR) total score.

**Interventions:** 12 wk of (1) fluoxetine (10-40 mg/d), (2) CBT, (3) CBT + fluoxetine (10-40 mg/d), or (4) placebo.

**Results:** Fluoxetine with CBT had a statistically significant CDRSR score as compared to placebo ( $P=0.001$ ) with a 71% response rate. This combo was greater than fluoxetine alone ( $P=0.02$ ), and CBT alone ( $P=0.01$ ). Fluoxetine alone was greater than CBT alone ( $P=0.01$ ).

## Anxiety Disorders

- prevalence 2-15%; F:M = 2:1

#### Diagnosis

- school problems, recurrent physical symptoms (abdominal pain, headaches) especially in mornings, social and relationship problems, social withdrawal and isolation, family conflict, irritability and mood symptoms, alcohol and drug use in adolescent

#### Treatment

- family psychotherapy, predictive and supportive environment
- CBT: child and parental education, relaxation techniques (e.g. deep breathing), exposure/desensitization, recognizing and correcting anxious thoughts
- pharmacotherapy: SSRIs (e.g. fluoxetine), benzodiazepines (e.g. clonazepam – use with caution, may have disinhibiting effect)
  - fluvoxamine and sertraline also have good evidence, particularly for OCD

## SEPARATION ANXIETY DISORDER

### Epidemiology

- prevalence: 4% of children/adolescents
- on average 7.5 yr old at onset, 10 yr old at presentation
- common for mother to have an anxiety or depressive disorder

### Differential Diagnosis

- simple or social phobia, depression, learning disorder, truancy, conduct disorder, school-related problems (e.g. bullying)

### Clinical Presentation

- excessive and developmentally inappropriate anxiety on separation from primary caregiver with physical or emotional distress for at least 4 wk
- school refusal (75%)
- persistent worry, refusal to sleep, clinging, nightmares, somatic symptoms
- comorbid major depression common (2/3)
- worry about something happening to parent or themselves if separated

### Prognosis

- if inadequately treated early on, may present later in a more severe form
- may develop into panic disorder with/without agoraphobia

## SOCIAL PHOBIA (SOCIAL ANXIETY DISORDER)

- must distinguish between shy child and child with social anxiety
  - diagnosis only if anxiety interferes significantly with daily routine, social life, academic functioning, or if markedly distressed
- features: temper tantrums, freezing, clinging behaviour, mutism, excessively timid, stays on periphery, refuses to be involved in group play
- must be capable of developing social relationships
- must occur in settings with peers, not just adults
- selective mutism:
  - does not speak in front of others; no problems speaking at home
  - must rule out language or communication problems
  - severe form of social anxiety

## POST-TRAUMATIC STRESS DISORDER

- diagnostic criteria same as adults (see *PTSD*, PS17)
  - in children, reliving of the trauma may occur through repetitive play which simulates the event, nightmares of the trauma which may progress to generalized nightmares (e.g. monsters), psychosomatic symptoms, omen formation (belief that there were predictors of the trauma which can be avoided in the future to escape future trauma)
- common examples include: sexual/physical abuse, witnessing family violence, natural disasters
- can also be associated with onset of sexual activity

## OBSESSIVE-COMPULSIVE DISORDER

- diagnostic criteria same as adults, except it is not necessary for child to recognize thoughts or actions as excessive or unreasonable (see *OCD*, PS16)
- 0.3-1% of children/adolescents; tends to begin earlier in boys than girls
  - tend to engage in rituals at home rather than in front of others
  - associated with Tourette's disorder, tics, and ADHD
  - small subset associated with Group A Strep infections; has prepubertal onset and neurologic symptoms

## PANIC DISORDER

- diagnostic criteria same as adults (see *Panic Disorder*, PS14)
- genetic/parental modeling/identification hypothesized as cause
- often parent with panic or depressive disorder

## GENERALIZED ANXIETY DISORDER

- diagnostic criteria same as adults (see *GAD*, PS15)
  - **Note:** Only 1 item is required in children for Criteria C
- often redo tasks, show dissatisfaction with their work and tend to be perfectionistic
- often require reassurance and support to take on new tasks

## SPECIFIC PHOBIA

- common phobias in childhood include a fear of heights, small animals, doctors, dentists, darkness, loud noises, thunder and lightning

### Newer Generation Antidepressants for Depressive Disorders in Children and Adolescents

*Cochrane DB Syst Rev* 2012;11:CD004851

**Study:** Meta-analysis of 19 trials containing 3335 participants (including RCTs, cross-over trials and cluster trials).

**Population:** Children and adolescents aged 6-18 yr with diagnosed depressive disorder.

**Interventions:** Antidepressants, placebo.

**Main Outcome Measure:** Depression severity score.

**Results:** Children treated with an antidepressant had lower depression severity score and higher rates of response/remission. Children on antidepressants were also found to be at increased risk (58%) of suicide-related outcome (RR 1.58; 95% CI 1.02 to 2.45).

**Conclusions:** In children and adolescents, antidepressants are effective at treating depression, yet may cause a higher chance of suicide-related outcomes.

The shy child is quiet and reluctant to participate but slowly 'warms up'.

## Childhood Schizophrenia

### Epidemiology

- 1/2,000 in childhood; increases after puberty to adult rates (1%) in late adolescence
- diagnostic criteria same as in adults (see *Schizophrenia*, PS6)
- less elaborate delusions than adults and visual hallucinations are more common
- <6 yr old may present in similar fashion to autism prior to onset of core symptoms
- prognosis poor as cognitive, language, social and personality development are disrupted

### Treatment

- psychotherapy, family education
- low dose antipsychotics for psychotic symptoms (e.g. hallucinations) and target behaviours (e.g. aggression, hyperactivity, impulsiveness)
- hospitalization or residential placement, if severe

Disorganized speech and behaviour is associated with many childhood disorders which must be differentiated from schizophrenia (e.g. Communication Disorders, Pervasive Developmental Disorders, ADHD, Stereotypic Movement Disorders)

## Pervasive Developmental Disorders

- include autism, Asperger's, childhood disintegrative disorder, Rett's disorder, and PDD NOS
- M:F = 3-4:1 (except for Rett's with female predominance)

### Differential Diagnosis

- developmental disability, childhood schizophrenia, social phobia, OCD, communication disorder, non-verbal learning disorder, ADHD, abuse, hearing or visual impairment, seizure disorder, motor impairment

### Management

- hearing test to rule out impairment
- psychological testing to assess intellectual functioning and learning
- chromosomal analysis to rule out abnormalities (e.g. trisomy 21, fragile X syndrome)
- rule out psychotic disorders, social problems, depression, anxiety, abuse

### Treatment

- team-based: school, psychologist, occupational therapist, physiotherapist, speech and language therapy, audiology, pediatrics, psychiatry
- family education and support
- treat concomitant disorders such as tics, OCD, anxiety, depression, and seizure disorder
- behaviour management, school programming
- pharmacotherapy: atypical antipsychotics (for aggression, agitation, self-mutilation, tics), SSRIs (for anxiety, depression), stimulants (for associated inattention and hyperactivity)

### Prognosis

- variable, but improves with early intervention
- better if IQ >60 and able to communicate
- **Note:** DSM-V has resulted in significant changes to these diagnoses. Autism, Asperger's disorder, childhood disintegrative disorder and PDD NOS will be subsumed by the diagnosis of autism spectrum disorder

## AUTISTIC DISORDER

- prevalence 1/1,000
- abnormalities in three areas:
  - **social interaction:** impaired non-verbal behaviours (eye contact, facial expression, hand gestures); failure to develop appropriate peer relationships; lack of seeking to share enjoyment/interests; lack of social/emotional reciprocity
  - **communication:** delay or lack of development of spoken language; impaired ability to start or sustain conversation with others; stereotyped/repetitive or idiosyncratic use of language; lack of make-believe play
  - **restricted and repetitive behaviours, interests, and activities:** stereotyped or restricted patterns of interest with abnormal intensity or focus; inflexible adherence to specific, non-functional routines; stereotyped hand or body movements (e.g. rocking); preoccupation with parts of objects (e.g. spinning wheels on toy cars only)
- at least 6 features before 3 yr old (at least 2 from social interaction and 1 from other 2 categories)

## ASPERGER'S DISORDER

- prevalence 3/1,000
- no early speech and language delay, no cognitive deficits (express normal curiosity in environment and develop age-appropriate learning skills, self-help and adaptive behaviours), normal to high intelligence
- at least 2 items from social interaction and 1 from repetitive behaviours categories of autistic disorder criteria

### Asperger's vs. Autism

Children with Asperger's have no delay or abnormality in language or cognition. Autism must have age of onset by 3 years whereas Asperger's may not be diagnosed until later in life.

## CHILDHOOD DISINTEGRATIVE DISORDER (CDD)

- similar to autism, but there must be a period of at least 2 yr (and up to 10 yr) of normal development followed by regression in multiple areas of functioning
- associated with developmental disability
- rule out degenerative brain disease, schizophrenia, general medical conditions

## RETT'S DISORDER

- X-linked dominant disorder, therefore predominantly in girls
- restriction of brain growth beginning in first year of life
- normal development between 6 mo to 4 yr, then regression (loss of purposeful hand movements, developmental disability, seizures, neurological, respiratory and motor deficits)

	Rett's	CDD
<b>Development</b>	Normal development and head size until ≥5 mo	Normal development for ≥2 yr
<b>Incidence</b>	6-7/100,000 females	1/100,000 boys > girls
<b>Deficits</b>	Decreased head growth, hand movements, skills (social, coordination, language)	Decreased skills (language, social, motor), bowel/bladder control, play

### Observe child for "ATTENTION" features

Annoying  
Temperamental  
Energetic  
Noisy  
Task incompletion  
Inattentive  
Oppositional  
Negativism

### A Systematic Review and Analysis of Long-term Outcomes in Attention Deficit Hyperactivity Disorder: Effects of Treatment and Non-treatment

*BMC Med* 2012;10:99

**Study:** Systematic review of 351 studies.

**Purpose:** To determine the long-term outcomes of ADHD and whether there is an effect on long-term outcomes with treatment.

**Population:** Patients with diagnosed or symptomatic presentation of ADHD.

**Interventions:** No treatment (control), Treatment (pharmacological, non-pharmacological and multi-modal).

**Outcome Groups:** Drug use/addictive behavior, academic outcomes, antisocial behavior, social function, occupation, self-esteem, driving outcomes, services use, obesity.

**Results:** Untreated participants with ADHD had poorer outcomes vs. non-ADHD participants in 74% (n=244) of studies, while 26% (n=89) showed similar outcomes. 72% (n=37) of studies showed a benefit from ADHD treatment vs. untreated ADHD and 28% (n=15) showed no benefit. Treatment of ADHD was found to be beneficial in studies looking at driving (100%), obesity (100%), self-esteem (90%), social function (83%), academic outcomes (71%), drug use/addictive behavior (67%), antisocial behavior (50%) and occupation (33%).

**Conclusions:** Overall, people with ADHD have poorer long-term outcomes than controls (those without ADHD). For those with ADHD, treatment improves long-term outcomes.

## Attention Deficit Hyperactivity Disorder

- prevalence: 5-12% of school-aged children; M:F = 4:1, although girls may be under-diagnosed
- girls tend to have inattentive/distractible symptoms; boys have impulsive/hyperactive symptoms

### Etiology

- genetic: dopamine candidate genes, catecholamine/neuroanatomical hypothesis
- cognitive: developmental disability, inhibitory control and other errors of executive function
- arousal: alterations in the sensory system filters

### Diagnosis

- differential: learning disorders, hearing/visual defects, thyroid, atopic conditions, congenital problems (fetal alcohol syndrome, Fragile X), lead poisoning, history of head injury, traumatic life events (abuse)
- diagnosis (3 subtypes):
  - **Combined Type:** 6 or more symptoms of inattention and 6 or more symptoms of hyperactivity-impulsivity
  - **Predominantly Inattentive Type:** 6 or more symptoms of inattention
  - **Predominantly Hyperactive-Impulsive Type:** 6 or more symptoms of hyperactivity-impulsivity
  - symptoms persist for >6 mo
  - onset before age 7
  - symptoms present in at least two settings (i.e. home, school, work)
  - interferes with academic, family, and social functioning
  - does not occur exclusively during the course of another psychiatric disorder

**Table 14. Core Symptoms of ADHD (DSM-IV)**

Inattention	Hyperactivity	Impulsivity
Careless mistakes	Fidgets, squirms in seat	Blurts out answers before questions completed
Cannot sustain attention in tasks or play	Leaves seat when expected to remain seated	Difficulty awaiting turn
Does not listen when spoken to directly	Runs and climbs excessively	Interrupts/intrudes on others
Fails to complete tasks	Cannot play quietly	
Disorganized	On the "go", driven by a motor	
Avoids, dislikes tasks that require sustained mental effort	Talks excessively	
Loses things necessary for tasks or activities		
Distractible		
Forgetful		

### Features

- average onset 3 yr old
- identification upon school entry
- rule out developmental delay, genetic syndromes, encephalopathies or toxins (alcohol, lead)
- risk of substance abuse, particularly cannabis and cocaine, depression, anxiety, academic failure, poor social skills, risk of comorbid CD and/or ODD, risk of adult ASPD
- associated with family history of ADHD, difficult temperamental characteristics

### Treatment

- non-pharmacological: parent management, anger control strategies, positive reinforcement, social skills training, individual/family therapy, resource room, tutors, classroom intervention, exercise routines, extracurricular activities
- pharmacological
  - standard treatment:
    - ♦ stimulants: methylphenidates [Ritalin<sup>®</sup>, Concerta<sup>®</sup> (long-acting)], Bupropion<sup>®</sup>
    - ♦ amphetamines: dextroamphetamine, mixed amphetamine salts (Adderall<sup>®</sup>), lisdexamfetamine (Vyvanse<sup>®</sup>)
    - ♦ SNRI: atomoxetine (Strattera<sup>®</sup>)
  - for comorbid symptoms: antidepressants, antipsychotics

### Prognosis

- 65% continue into adulthood; secondary personality disorders and compensatory anxiety disorders are identifiable
- 70-80% continue into adolescence, but hyperactive symptoms usually abate

## Oppositional Defiant Disorder

- prevalence: 2-16%

### Diagnosis

- pattern of negativistic/hostile and defiant behaviour for  $\geq 6$  mo with  $\geq 4$  of:
  - loses temper, argues with adults, defies adult rules, deliberately annoys, blames others, touchy/easily annoyed, angry and resentful, spiteful or vindictive
- behaviour causes significant impairment in social, academic or occupational functioning
- behaviours do not occur exclusively during the course of a psychotic or mood disorder
- criteria not met for conduct disorder (CD); if 18 yr or older, criteria not met for ASPD
- features that typically differentiate ODD from transient developmental stage: onset  $< 8$  yr, chronic duration ( $> 6$  mo), frequent intrusive behaviour
- impact of ODD: poor school performance, few friends, strained parent/child relationships
- may progress to CD

### Treatment

- establish boundaries
- parent management training and psychoeducation
- individual/family therapy
- pharmacotherapy for comorbid disorders
- school/day care interventions to help with behaviour management

#### ODD kids "ARE BRATS"

Annoying  
Resentful  
Easily annoyed  
Blames others  
Rule breaker  
Argues with adults  
Temper  
Spiteful/vindictive

## Conduct Disorder

- prevalence: 1.5-3.4% (M:F = 4-12:1)

### Etiology

- parental/familial factors: parental psychopathology (e.g. ASPD, substance abuse), child rearing practices (e.g. child abuse, discipline), low socio-economic status (SES), family violence
- child factors: difficult temperament, ODD, learning problems, neurobiology

### Diagnosis

- differential: ADHD, depression, head injury, substance abuse
- diagnosis: use multiple sources (Achenbach Child Behavioural Checklist, Teacher's Report Form)
  - pattern of behaviour that violates rights of others and age appropriate social norms with  $\geq 3$  criteria noted in past 12 mo and  $\geq 1$  in past 6 mo:
    - ♦ aggression to people and animals (bullying, physical fights, use of weapons, forced sex)
    - ♦ destruction of property, firesetting with intent to damage
    - ♦ deceitfulness or theft (breaking and entering, car theft)
    - ♦ violation of rules (out all night before age 13, runaway  $\geq 2$  times or for long periods of time, often truant from school before age 13)
  - disturbance causes clinically significant impairment in social, academic or occupational functioning
  - if individual is 18 yr or older, criteria not met for ASPD
- diagnostic types
  - childhood onset: at least one criterion prior to age 10
    - ♦ poor prognosis: associated with ODD, aggressiveness, impulsiveness
  - adolescent onset: absence of any criteria until age 10
    - ♦ better prognosis; least aggressive, gang-related delinquency
  - mild, moderate, severe

#### Conduct Disorder Diagnosis

##### TRAP

Theft: breaking and entering, deceiving, non-confrontational stealing  
Rule breaking: running away, skipping school, out late  
Aggression: people, animals, weapons, forced sex  
Property destruction

## Treatment

- early intervention necessary and more effective; long-term follow-up required
- parent management training, anger replacement training, CBT, family therapy, education/employment programs, social skills training, medications for aggressiveness or comorbid disorders
- pharmacotherapy is insufficient; mainly used for treatment of comorbid disorders

## Prognosis

- poor prognostic indicators include early-age onset, high frequency and variety of behaviours, pervasiveness (i.e. in home, school, community), comorbid ADHD, early sexual activity, substance abuse
- 50% of CD children become adult ASPD

- see [Pediatrics](#):

- *Child Abuse*, [Pediatrics](#) P14
- *Chronic Recurrent Abdominal Pain*, [Pediatrics](#) P39
- *Developmental Delay*, [Pediatrics](#) P22
- *Intellectual Disability*, [Pediatrics](#) P23
- *Learning Disability*, [Pediatrics](#) P25
- *Elimination Disorders*, [Pediatrics](#) P9
- *Sleep Disturbances*, [Pediatrics](#) P12

- see [Neurology](#):

- *Tic Disorders*, [Neurology](#), N28
- *Tourette's Syndrome*, [Neurology](#), N28

## Psychotherapy

- theory: one's present outlook is shaped by one's past and unconscious psychological forces
- insight allows change in personality and behaviour
- conflict – three stages
  - non-resolvable conflict
  - attempt to repress
  - return of conflict in disguised form (symptom or character trait)
- emphasis on early interaction with caregiver
- sources of information
  - past and present experiences and relationships
  - relationship with therapist
    - ♦ **transference**: unconscious reenactment of early interpersonal patterns in relationship with therapist
    - ♦ **countertransference**: therapist's transference to patient
    - ♦ **resistance**: elements in the patient which oppose treatment
- techniques
  - free association: patient says whatever comes to mind
  - dream analysis
- Prochaska's stages of change model is important for all conflict resolutions

## Defense Mechanisms

- defense mechanisms are unconsciously activated by the patient in response to anxiety provoking events and feelings

**Table 15. Defense Mechanisms**

<b>Level 1: Psychotic Defenses</b> Common in psychosis; normally seen throughout childhood and in dreams	
	<ul style="list-style-type: none"> <li>• <b>Denial</b>: replacing external reality with wishful fantasy</li> <li>• <b>Distortion</b>: reshaping of reality to meet inner beliefs</li> <li>• <b>Projection</b>: interpreting internal impulses as though they are outside oneself; in psychosis seen as frank delusion about reality (e.g. persecutory delusions)</li> </ul>
<b>Level 2: Immature Defenses</b> Common in personality disorders, severe depression. Normally seen throughout adolescence	
	<ul style="list-style-type: none"> <li>• <b>Acting out</b>: express unconscious wish through impulsive action</li> <li>• <b>Blocking</b>: of thinking, affect, or impulse</li> <li>• <b>Hypochondriasis</b>: exaggeration of illness</li> <li>• <b>Introjection</b>: internalizing qualities of an object (i.e. victim identifying with aggressor)</li> <li>• <b>Passive-aggressive behaviour</b></li> <li>• <b>Regression</b>: returning to an earlier stage of development to avoid present stressors</li> <li>• <b>Somatization</b>: unconscious expression of psychic pain/tension as physical symptoms</li> </ul>

**Table 15. Defense Mechanisms** (continued)

<b>Level 3: Neurotic Defenses</b> Common in adults	<ul style="list-style-type: none"> <li>• <b>Controlling</b></li> <li>• <b>Displacement:</b> shifting emotional response to an object/idea resembling that which is anxiety provoking</li> <li>• <b>Externalization:</b> attributing moods/attitudes/conflicts to external world or objects</li> <li>• <b>Inhibition:</b> limiting function to avoid anxiety producing internal conflicts</li> <li>• <b>Intellectualization:</b> using intellectual processing to avoid experiencing affect</li> <li>• <b>Isolation</b></li> <li>• <b>Rationalization:</b> using rational explanations to justify behaviours that are unacceptable</li> <li>• <b>Dissociation:</b> temporary modification of sense of self to avoid emotional distress</li> <li>• <b>Reaction formation:</b> transforming an unacceptable impulse into its opposite</li> <li>• <b>Repression:</b> withholding or removing from consciousness an idea/feeling</li> <li>• <b>Sexualization</b></li> </ul>
<b>Level 4: Mature Defenses</b> Common in emotionally healthy adults	<ul style="list-style-type: none"> <li>• <b>Altruism</b></li> <li>• <b>Anticipation:</b> planning for future discomfort</li> <li>• <b>Asceticism:</b> denying pleasurable effects of an experience</li> <li>• <b>Humour</b></li> <li>• <b>Suppression:</b> postpone attention to impulse or conflict</li> </ul>

## Psychodynamic Therapy

- **psychoanalysis** (exploratory psychotherapy)
  - original therapy developed by Freud, goal is self-revelation and insight
  - the exploration of the meaning of early experiences and how they affect emotions and patterns of behaviour presently
  - time intensive (e.g. 4-5 times/wk for 3-7 yr)
  - for individuals who can tolerate ambiguity in explorations of feelings and treatment
- **supportive psychotherapy**
  - goal is not insight but reduction of anxiety
  - strengthen healthy defense mechanisms to assist day-to-day functioning
  - techniques include: enhancing self-esteem, clarification, confrontation, rationalization, reframing, encouragement, rehearsal/anticipation, de-catastrophizing, allowing “venting” of frustrations
- **short term/brief psychotherapy**
  - resolution of particular emotional problems, or acute crisis
  - number of sessions agreed on at outset (6-20)
- **interpersonal psychotherapy**
  - short-term treatment looking at relationship patterns and teaching coping mechanisms
  - focus on personal social roles and relationships to help deal with problems in current functioning

## Behaviour Therapy

- modification of internal or external events which precipitate or maintain emotional distress; useful in the treatment of anxiety disorders, substance abuse, paraphilias
- **systematic desensitization:** mastering anxiety-provoking situations by approaching them gradually and in a relaxed state that limits anxiety
- **flooding:** confronting feared stimulus for prolonged periods until it is no longer frightening
- **positive reinforcement:** strengthening behaviour and causing it to occur more frequently by rewarding it
- **negative reinforcement:** causing behaviour to occur more frequently by removing a noxious stimulus when desired behaviour occurs
- **extinction:** causing a behaviour to diminish by not rewarding it
- **punishment** (aversion therapy): causing a behaviour to diminish by applying a noxious stimulus

## Cognitive Therapy

- theory: moods/emotions are influenced by one's thoughts
- psychiatric disturbances are frequently caused by habitual errors in thinking
- goal is to help patient become aware of inaccurate automatic thoughts and correct assumptions with a more balanced perspective
- useful for depression, anxiety disorders, self-esteem problems
- use of this therapy presupposes a significant level of functioning of the patient
- patients asked to keep thought records (often in chart form, with column headings “situation”, “feeling”, “thought” and “cognitive distortion”) to monitor their thoughts, when/where they think these thoughts, how the thoughts make them feel and what their underlying error in thinking might be

## Cognitive Behavioural Therapy (CBT)

- combines cognitive and behaviour therapies to teach the patient to weaken connections between thinking patterns, habitual behaviours and mood/anxiety problems
- good for treatment of mild/moderate depression/anxiety

## Dialectical Behavioural Therapy (DBT)

- therapy that combines CBT techniques with approaches derived from Buddhist meditation practices
- originally developed for borderline patients but has since been found to be effective for the treatment of several other disorders
- focuses on four types of skills: mindfulness, emotion regulation, interpersonal effectiveness, and distress tolerance
- individual and group therapy settings

## Other Therapies

- **group psychotherapy**
  - goals: self-understanding, acceptance, social skills
- **family therapy**
  - family system considered more influential than individual especially for children
  - focus on here and now, re-establishing parental authority, strengthening normal boundaries, and rearranging alliances
- **hypnosis**: mixed evidence for the treatment of pain, phobias, anxiety, and smoking cessation
- **mindfulness-based cognitive therapy**: derived from Buddhist meditative practices; aims to help people attend to thoughts, behaviours and emotions non-judgmentally and in the moment using guided breathing exercises

## Pharmacotherapy

### Antipsychotics

- “antipsychotics” and “neuroleptics” are terms used interchangeably
- **indications**: schizophrenia and other psychotic disorders, mood disorders with or without psychosis, violent behaviour, autism, Tourette’s, somatoform disorders, dementia, OCD
- **onset**: immediate calming effect and decrease in agitation; thought disorder responds in 2-4 wk
- **rational use**:
  - no reason to combine antipsychotics
  - choosing an antipsychotic:
    - ♦ all antipsychotics are equally effective, except for clozapine
    - ♦ atypical antipsychotics are as effective as typical or first generation antipsychotics but are thought to have better side effect profiles
    - ♦ choose a drug that the patient has responded to in the past or that was used successfully in a family member
  - route: PO, short-acting or long-acting depot IM injections, sublingual
  - duration: minimum 6 mo, usually for life

#### Long-Acting Preparations

- antipsychotics formulated in oil for IM injection (see Table 17)
- received on an outpatient basis
- indications: individuals with schizophrenia or other chronic psychosis who relapse because of non-adherence
- dosing: start at low dosages, and then titrate every 2 to 4 wk to maximize safety and minimize side effects
- should be exposed to oral form prior to first injection
- side effects: risk of EPS, parkinsonism, increased risk of neuroleptic malignant syndrome

#### Canadian Guidelines for the Treatment of Acute Psychosis in the Emergency Setting

- haloperidol 5 mg IM ± lorazepam 2 mg IM
- olanzapine 2.5-10 mg (PO, IM, quick dissolve)
- risperidone 2 mg (M-tab, liquid)

#### Two-year Randomized Controlled Trial and Follow-up of Dialectical Behaviour Therapy vs. Therapy by Experts for Suicidal Behaviours and Borderline Personality Disorder

*Arch Gen Psychiatry* 2006;63:757-66

**Objective:** To determine how DBT compares with non-behavioural psychotherapy.

**Study:** One-year randomized controlled trial followed by one year follow-up period.

**Patients:** 100 women with recent suicidal and self-injurious behaviours meeting DSM criteria and matched to various demographic data.

**Intervention:** One year of DBT or one year of non-behavioural therapy.

**Outcomes:** Trimester assessments of suicidal behaviour, emergency services use, general psychological well-being.

**Results:** Patients receiving DBT were half as likely to attempt suicide, required less hospitalization for suicidal ideation, had lower medical risk for suicide attempts, were less likely to drop out of therapy and had fewer emergency room visits for suicidal ideation.

**Conclusions:** DBT is effective in reducing suicidal behaviour in patients with borderline personality disorder.

#### Effectiveness of Antipsychotic Drugs in Patients with Chronic Schizophrenia

*NEJM* 2005;353:1209-23

**Study:** Randomized, double-blind, active-control trial with median follow-up of 6 mo.

**Patients:** 1432 patients with a diagnosis of schizophrenia (as per DSM-IV criteria) and able to take antipsychotic medications (as determined by study doctors). Mean age 41, 74% male, 26% female.

**Intervention:** 1 to 4 capsules daily of olanzapine (20.1 mg), quetiapine (543.4 mg), risperidone (3.9 mg), perphenazine (20.8 mg), or ziprasidone (112.8 mg), with dosage at the discretion of the study doctor. Mean modal doses in parentheses.

**Main Outcome:** Discontinuation of treatment for any cause

**Results:** Olanzapine group had statistically significant lower rate of discontinuation for any cause (64%) from all others (quetiapine – 82%, risperidone – 74%, perphenazine – 75%, ziprasidone – 79%). There were no significant differences in time until discontinuation due to intolerable side effects, however, olanzapine was associated with a significantly higher rate of metabolic side effects.

**Table 16. Pathophysiology of Schizophrenia vs. Mechanism of Action of Antipsychotics**

Brain Region	Pathophysiology in Schizophrenia	Typical Antipsychotic	Atypical Antipsychotic
<b>Limbic System</b>	Excess DA +ve symptoms (hallucinations, delusions)	D2 blockade Treats +ve symptoms	Weak 5-HT block, D2/1 blockade maintained Treats +ve symptoms
<b>Frontal Cortex</b>	Decreased DA -ve symptoms (flat affect, anhedonia, avolition), cognitive impairment	D2 blockade May worsen -ve symptoms and cognitive impairment	Robust 5-HT block increases DA transmission Theoretical improvement in negative/cognitive symptoms only observed with clozapine
<b>Basal Ganglia</b>	Unchanged	D2 blockade Relative ACh excess causes EPS symptoms	Robust 5-HT block increases DA transmission Decreased EPS incidence
<b>Tuberoinfundibular Tract</b>	Unchanged	D2 blockade Hyperprolactinemia	5-HT block increases DA Less hyperprolactinemia

DA = dopamine; 5-HT = serotonin; ACh = acetylcholine; EPS = extrapyramidal symptoms

Note: specific "typical" and "atypical" antipsychotics vary in terms of binding to adrenergic, 5-HT, cholinergic and histaminergic sites leading to different side effect profiles

**Table 17. Common Antipsychotic Agents**

	Starting Dose	Maintenance	Maximum	Relative Potency (mg)
<b>Typicals</b> (In order of potency from high to low)				
Haloperidol (Haldol®)	2-5 mg IM q4-8h 0.5-5 mg PO b/tid 0.2 mg/kg/d PO	Based on clinical effect	20 mg/d PO	2
Fluphenazine enanthate (Moditen®, Modecate® for IM formulation)	2.5-10 mg/d PO	1-5 mg PO qhs 25 mg IM/SC q1-3wk	20 mg/d PO	2
Zuclopenthixol HCl (Clopixol®)	20-30 mg/d PO	20-40 mg/d PO	100 mg/d PO	4
Zuclopenthixol acetate (Acuphase®)	50-150 mg IM q48-72h		400 mg IM (q2wk)	
Zuclopenthixol decanoate (Clopixol Depot®)	100 mg IM q1-4wk	150-300 mg IM q2wk	600 mg IM/wk	
Perphenazine (Trilafon®)	8-16 mg PO b/tid	4-8 mg PO t/qid	64 mg/d PO	10
Loxapine HCl (Loxitane®)	10 mg PO tid 12.5-50 mg IM q4-6h	60-100 mg/d PO	250 mg/d PO	10
Chlorpromazine (Largactil®)	10-15 mg PO b/t/qid	400 mg/d PO	1000 mg/d PO	100
<b>Atypicals</b> (in order of potency from high to low)				
Risperidone (Risperdal®, Risperdal Consta® for IM long acting preparation, Risperdal M-Tab for melting form – placed on tongue)	1-2 mg OD/bid	4-8 mg/d PO 25 mg IM q2wk	8 mg/d PO	2
Paliperidone (Invega®)	3 mg/d PO	3-12 mg/d PO	12 mg/d PO	4
Olanzapine (Zyprexa®, Zyprexa Zydys® for melting form – placed on tongue, Zyprexa Intramuscular®)	5 mg/d PO	10-20 mg/d PO	30 mg/d PO	5
Asenapine (Saphris®)	5 mg SL bid	5-10 mg SL bid	10 mg bid	5
Ziprasidone (Zeldox®)	20 mg bid PO	40-80 mg bid PO	160 mg/d PO	6
Aripiprazole (Ablify®)	10-15 mg/d PO	10-15 mg/d PO	30 mg/d PO	7.5
Quetiapine (Seroquel®, Seroquel XR for extended release®)	25 mg PO bid	400-800 mg/d PO	800 mg/d PO	75
Clozapine (Clozaril®)	25 mg PO bid	300-600 mg/d PO	600 mg/d PO	100

**Typical vs. Atypical Antipsychotics**

	Typical	Atypical
<b>Pros</b>	Inexpensive Plenty of injectible forms available	Fewer EPS Low risk of tardive syndromes Mood stabilizing
<b>Cons</b>	More EPS Tardive syndromes in long term Not mood stabilizing	Expensive Few injectible forms available Metabolic side effects (weight gain, hyperglycemia, lipid abnormalities, metabolic syndrome) Exacerbation (or new onset) of obsessive behaviour

Table 18. Commonly Used Atypical Antipsychotics

	Risperidone (Risperdal®)	Olanzapine (Zyprexa®, Zydys®)	Quetiapine (Seroquel®)	Clozapine (Clozaril®)	Aripiprazole (Abilify®)
<b>Mechanism</b>	Blocks 5-HT <sub>2</sub> , D2 and adrenergic receptors	Blocks 5-HT <sub>2,3,6</sub> , D1-D4, muscarinic, adrenergic, histaminergic receptors	Blocks 5-HT <sub>2A</sub> , D1-2, adrenergic and histaminergic receptors	Blocks 5-HT <sub>2,3</sub> , D1-4, muscarinic, histaminergic receptors	Partial agonist of D2, D3 and 5-HT <sub>1A</sub> receptors Antagonist of 5-HT <sub>2A</sub> receptors
<b>Advantages</b>	Low incidence of EPS at lower doses (< 8 mg)	Better overall efficacy compared to haloperidol Well tolerated Low incidence of EPS and TD	Associated with less weight gain compared to clozapine and olanzapine	Most effective for treatment-resistant schizophrenia Does not worsen tardive symptoms; may treat them Approximately 50% of patients benefit, especially paranoid patients and those with onset after 20 yr	Less weight gain and risk of metabolic syndrome compared to olanzapine and a lower incidence of EPS compared to haloperidol
<b>Disadvantages</b>	SE: insomnia, agitation, EPS, H/A, anxiety, prolactin, postural hypotension, constipation, dizziness, weight gain	SE: mild sedation, insomnia, dizziness, minimal anticholinergic, early AST and ALT elevation, restlessness Weight gain associated with increased risk of diabetes mellitus and hyperlipidemia	SE: H/A, sedation, dizziness, constipation Most sedating of first line atypicals	SE: drowsiness/sedation, hypersalivation, tachycardia, dizziness, EPS, NMS 1% agranulocytosis	SE: H/A, agitation, anxiety, insomnia, weight gain, decreased serum prolactin levels
<b>Comments</b>	Quick dissolve (M-tabs), and long-acting (Consta®) formulations available	Quick dissolve formulation (Zydys®) used commonly in ER setting for better compliance IM form available		Weekly blood counts for at least 1 mo, then q2wk Do not use with drugs which may cause bone marrow suppression due to risk of agranulocytosis	

Note: Risk of weight gain: Clozapine > Olanzapine > Quetiapine > Risperidone

Table 19. Side Effects of Antipsychotics

System	Side Effects
<b>Anticholinergic</b>	Dry mouth, urinary retention, constipation, blurred vision, toxic-confusional states
<b>α-adrenergic blockade</b>	Orthostatic hypotension, impotence, failure to ejaculate
<b>Dopaminergic blockade</b>	Extrapyramidal syndromes (dystonia, akathisia, pseudoparkinsonism, dyskinesia), galactorrhea, amenorrhea, impotence, weight gain
<b>Anti-histamine</b>	Sedation
<b>Hematologic</b>	Agranulocytosis (clozapine)
<b>Hypersensitivity reactions</b>	Liver dysfunction, blood dyscrasias, skin rashes, neuroleptic malignant syndrome, altered temperature regulation (hypothermia or hyperthermia)
<b>Endocrine</b>	Metabolic syndrome (see sidebar on PS42)

### Neuroleptic Malignant Syndrome (NMS)

- **psychiatric emergency**
- due to massive dopamine blockade; increased incidence with high potency and depot neuroleptics
- **risk factors**
  - medication factors
    - ♦ sudden increase in dosage, or starting a new drug
  - patient factors
    - ♦ medical illness
    - ♦ dehydration
    - ♦ exhaustion
    - ♦ poor nutrition
    - ♦ external heat load
    - ♦ sex: male
    - ♦ age: young adults

#### Commonly Used Atypical Antipsychotics

##### ROCS

Risperidone  
Olanzapine  
Clozapine  
Seroquel (quetiapine)

#### Anticholinergic Effects

**Red** as a beet  
**Hot** as a hare  
**Dry** as a bone  
**Blind** as a bat  
**Mad** as a hatter

#### Metabolic and Cardiovascular Adverse Effects Associated with Antipsychotic Drugs

*Nat Rev Endocrinol* 2012;8:114-126

**Study:** Review.

**Conclusions:** All antipsychotics can cause cardiovascular and metabolic side effects, such as obesity, dyslipidemia, hyperglycemia and metabolic syndrome. Olanzapine and clozapine are most likely to cause these side effects. The mechanism that underlies the metabolic and cardiovascular effects is not fully understood, however, the histamine, dopamine, serotonin and muscarinic receptors are implicated.

### • clinical presentation

- mental status changes (usually occur first), fever, autonomic reactivity, rigidity
- develops over 24-72 h
- labs: increased creatine phosphokinase, leukocytosis, myoglobinuria

### • treatment: discontinue drug, hydration, cooling blankets, dantrolene (hydrantoin derivative, used as a muscle relaxant), bromocriptine (DA agonist)

### • mortality: 5%

### Extrapyramidal Symptoms (EPS)

- incidence related to increased dose and potency
- acute (early-onset; reversible) vs. tardive (late-onset; often irreversible)

**Table 20 Extrapyramidal Symptoms**

	Dystonia	Akathisia	Pseudoparkinsonism	Dyskinesia
<b>Acute or Tardive</b>	Both	Both	Acute	Tardive
<b>Risk Group</b>	Acute: Young Asian and Black males	Elderly females	Elderly females	
<b>Presentation</b>	Sustained abnormal posture; torsions, twisting, contraction of muscle groups; muscle spasms (e.g. oculogyric crisis, laryngospasm, torticollis)	Motor restlessness; crawling sensation in legs relieved by walking; very distressing, increased risk of suicide and poor adherence	Tremor; rigidity (cogwheeling); akinesia; postural instability (decreased/absent arm-swing, stooped posture, shuffling gait, difficulty pivoting)	Purposeless, constant movements, involving facial and mouth musculature, or less commonly – the limbs
<b>Onset</b>	Acute: within 5 d Tardive: >90 d	Acute: within 10 d Tardive: >90 d	Acute: within 30 d	Tardive: >90 d
<b>Treatment</b>	Acute: benztropine or diphenhydramine	Acute: lorazepam, propranolol or diphenhydramine; reduce or change neuroleptic to lower potency	Acute: benztropine (or benzodiazepine if side effects); reduce or change neuroleptic to lower potency	Tardive: no good treatment; may try clozapine; discontinue drug or reduce dose

### Antiparkinsonian Agents (Anticholinergic Agents)

- types
  - benztropine (Cogentin®) 2 mg PO, IM or IV OD (~1-6 mg)
  - amantadine (Symmetrel®) 100 mg PO bid (100-400 mg)
  - diphenhydramine (Benadryl®) 25-50 mg PO/IM qid
- do not always prescribe with neuroleptics
  - give only if at high risk for acute EPS or if acute EPS develops
- do not give these for tardive syndromes because they worsen the condition

### Features of Neuroleptic Malignant Syndrome

#### FARM

##### Fever

Autonomic changes (e.g. increased HR/BP, sweating)

##### Rigidity of muscles

Mental status changes (e.g. confusion)

FARM symptoms are also seen in Serotonin Syndrome (SS).

SS can be distinguished from NMS by the following:

SS	NMS
Twitchy, shivering, restless	Severe global rigidity
Flushed, sweaty	Pallor
Vomiting, diarrhea, abdominal pain	No GI symptoms

**Tardive Dyskinesia** may include grimacing, tongue protrusion, lip smacking, and rapid eye movement.

## Antidepressants

- onset of effect
  - relief of neurovegetative symptoms: 1-3 wk
  - relief of emotional/cognitive symptoms: 2-6 wk
- may use mild stimulant (e.g. methylphenidate) for severe neurovegetative symptoms briefly and taper down as antidepressant effect increases
- taper TCAs slowly (over weeks-months) because they can cause withdrawal reactions
- tapering of any kind of antidepressant may be required based on the half-life of the medication and the patient's individual sensitivity
- it is important to be particularly vigilant over the first 2 wk of therapy as neurovegetative symptoms may start to resolve while emotional and cognitive symptoms may not (patients may be particularly at risk for suicidal behaviour during this time)
- treatment of bipolar depression:
  - monotherapy with antidepressants is not advisable as a switch from depression to mania can occur
  - patients with bipolar disorder should only be treated with an antidepressant if it is combined with a mood stabilizer and antipsychotic
  - for patients taking mood stabilizers or antipsychotics, consider adding or switching to lithium or lamotrigine, or adding an SSRI or bupropion

### Selective Serotonin Reuptake Inhibitors (SSRIs) versus Other Antidepressants for Depression

Cochrane DB Syst Rev 2004; Issue 3

This systematic review of 98 RCTs compared the efficacy of SSRIs with other kinds of antidepressants in the treatment of patients with depressive disorders.

**Conclusions:** There is no significant difference in the effectiveness of SSRIs versus TCAs. Consider relative patient acceptability, toxicity and cost when choosing.

Table 21. Common Antidepressants

Class	Drug	Daily Starting Dose (mg)	Therapeutic Dose (mg)
SSRI	fluoxetine (Prozac®)	20	20-80
	fluvoxamine (Luvox®)	50-100	150-300
	paroxetine (Paxil®)	10	20-60
	sertraline (Zoloft®)	50	50-200
	citalopram (Celexa®)	20	20-40
	escitalopram (Cipralex®)	10	10-20
SNRI	venlafaxine (Effexor®)	37.5-75	75-225
	duloxetine (Cymbalta®)	40	40-60
NDRI	bupropion (Wellbutrin®)	100	300-450
TCA (3° Amines)	amitriptyline (Elavil®)	75-100	150-300
	imipramine (Tofranil®)	75-100	150-300
TCA (2° Amines)	nortriptyline (Aventyl®)	75-100	75-150
	desipramine (Norpramin®)	100-200	150-300
MAOI	phenelzine (Nardil®)	45	60-90
	tranylcypromine (Parnate®)	30	10-60
RIMA	moclobemide (Manerix®)	300	300-600
NASSA	mirtazapine (Remeron®)	15	15-45

(SSRI=selective serotonin reuptake inhibitors; SNRI=serotonin and norepinephrine reuptake inhibitors; NDRI=norepinephrine and dopamine reuptake inhibitors; TCA=tricyclic antidepressants; MAOI= monoamine oxidase inhibitors; RIMA=reversible inhibition of MAO-A; NASSA=noradrenergic and specific serotonin antagonists)

#### Tips On Choosing Antidepressants

- All SSRIs have similar effectiveness, but consider side effect profiles and half-lives
- Bupropion causes less sexual dysfunction, weight gain, and sedation but is contraindicated for patients with history of seizure, stroke, brain tumour, brain surgery or closed head injury. Also used to treat eating disorders. Not recommended for anxiety because of stimulating effects
- Mirtazapine useful if insomnia or agitation are prominent, or to treat depression with cachexia
- Trazodone mainly used as adjunct for SSRI-induced sleep disturbances
- Sertraline, citalopram, and escitalopram have the least interactions with other drugs and are sleep-wake neutral
- Fluoxetine and paroxetine are the most activating drugs and should be taken in the morning
- Fluvoxamine is always sedating and should be taken in the evening

### Treatment Strategies for Refractory Depression

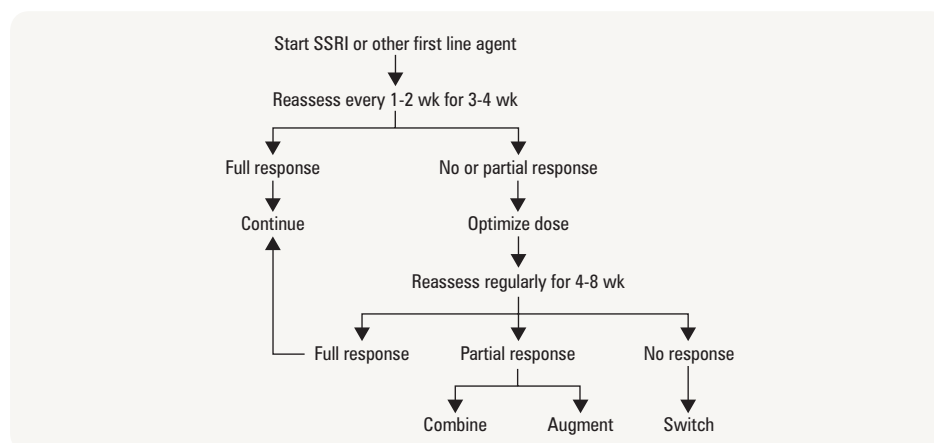

Figure 3. Treatment of depression

- **optimization:** ensuring adequate drug doses for the individual
- **augmentation:** the addition of a medication that is not considered an antidepressant to an antidepressant regimen (e.g. thyroid hormone, lithium, atypical antipsychotics)
- **combination:** the addition of another antidepressant to an existing treatment regimen (e.g. the addition of bupropion to an SSRI or SNRI)
- **substitute:** change in the primary antidepressant (within or outside a class)
- **note:** it is important to fully treat the symptoms of depression in order to decrease rates and severity of relapses

#### How Long to Treat?

- **6-12 mo:** if first or second episode.
- **2 yr:** if third episode, elderly, psychotic features, refractory depression, > 2 episodes in 5 yr.

#### Psychopharmacology of SSRIs

Post-Synaptic Serotonin Receptor Stimulated	Effect/Side Effect
5HT1A centrally	<ul style="list-style-type: none"> <li>• Relief of depression</li> <li>• Anxiolytic effect</li> </ul>
5HT2A in spinal cord	<ul style="list-style-type: none"> <li>• Sexual dysfunction: delayed ejaculation, anorgasmia, decreased interest/libido</li> </ul>
5HT2C/5HT2A in brain	<ul style="list-style-type: none"> <li>• Activation: anxiety, insomnia</li> <li>• Worst with fluoxetine, paroxetine</li> <li>• Warn patients anxiety may worsen in first 1-2 wk of treatment</li> </ul>
5HT3A in gut	<ul style="list-style-type: none"> <li>• GI upset: nausea, vomiting, bloating</li> <li>• Take with food</li> </ul>

Table 22. Commonly Used Antidepressants

	TCA	SSRI	MAOI	SNRI
<b>Considerations</b>	OCD (clomipramine), melancholic depression	Anxiety states, OCD, eating disorders, seasonal depression, typical and atypical depression	For moderate/severe depression that does not respond to SSRI, atypical depression	Depression, anxiety disorders
<b>Mode of Action</b>	Block norepinephrine and serotonin reuptake	Block serotonin reuptake only	Irreversible inhibition of monoamine oxidase A and B Leads to ↑ norepinephrine and serotonin	Block norepinephrine and serotonin reuptake
<b>Side Effects</b>	Anticholinergic effects: (see Table 19) Noradrenergic effects: tremors, tachycardia, sweating, insomnia, erectile and ejaculation problems $\alpha$ -1 adrenergic effects: orthostatic hypotension Antihistamine effects: sedation, weight gain CNS: sedation, stimulation, ↓ seizure threshold CVS: ↑ HR, conduction delay	Fewer than TCA, therefore increased compliance CNS: restlessness, tremor, insomnia, headache, drowsiness GI: N/V, diarrhea, abdominal cramps, weight loss Sexual dysfunction: impotence, anorgasmia CVS: increased HR, conduction delay, serotonin syndrome, EPS, SIADH	Hypertensive crises with tyramine rich foods (e.g. wine, cheese), headache, flushes, palpitations, N/V, photophobia Dizziness, reflex tachycardia, postural hypotension, sedation, insomnia Weight gain Social dysfunction Energizing Minimal anticholinergic and antihistamine effects	Low dose side effects include insomnia (serotonergic) Higher dose side effects include: tremors, tachycardia, sweating, insomnia, dose-dependent increase in diastolic BP (noradrenergic)
<b>Risk in Overdose</b>	Toxic in OD 3 times therapeutic dose is lethal Presentation: anticholinergic effects, CNS stimulation, then depression and seizures ECG: prolonged QT (duration reflects severity) Treatment: activated charcoal, cathartics, supportive treatment, IV diazepam for seizure, physostigmine salicylate for coma Do not give ipecac, as can cause rapid neurologic deterioration and seizures	Relatively safe in OD	Toxic in OD, but wider margin of safety than TCA	Tachycardia and N/V seen in acute overdose
<b>Drug Interactions</b>	MAOI, SSRI EtOH	SSRIs inhibit P450 enzymes, therefore will affect levels of drugs metabolized by P450 system	EtOH Hypertensive crises with noradrenergic medications (e.g. TCA, decongestants, amphetamines) Serotonin syndrome with serotonergic drugs (e.g. SSRI, tryptophan, dextromethorphan)	MAOI, SSRI Does not seem to inhibit P450 system
	NDRI	RIMA	NASSA	
<b>Considerations</b>	Depression, seasonal depression	Depression unresponsive to other therapies	Useful in patients with insomnia, agitation or depression with cachexia	
<b>Mode of Action</b>	Block norepinephrine and dopamine reuptake	Reversible inhibitor of monoamine oxidase A Leads to ↑ norepinephrine and serotonin	Enhance central noradrenergic and serotonergic activity by inhibiting presynaptic $\alpha$ -2 adrenergic receptors	
<b>Side Effects</b>	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, hypertension GI: dry mouth, N/V, constipation, ↓ appetite Other: agitation, anxiety, anaphylactoid reaction	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, hypotension GI: dry mouth, N/V, diarrhea, abdominal pain, dyspepsia GU: delayed ejaculation Other: diaphoresis	CNS: somnolence, dizziness, seizure (rare) Endocrine: ↑ cholesterol, ↑ triglycerides GI: constipation, ↑ ALT	
<b>Risk in Overdose</b>	Tremors and seizures seen in acute overdose	Risk of fatal overdose when combined with citalopram or clomipramine	Mild symptoms with overdose	
<b>Drug Interactions</b>	MAOI Drugs that reduce seizure threshold: antipsychotics, systemic steroids, quinolone antibiotics, antimalarial drugs	MAOI, SSRI, TCA Opioids	MAOI, SSRI, SNRI, RIMA	

## Serotonin Syndrome

- thought to be due to over-stimulation of the serotonergic system
- can result from medication combinations such as SSRI+MAOI, SSRI+tryptophan, MAOI+meperidine, MAOI+tryptophan
- rare but potentially life-threatening adverse reaction to SSRIs, especially when switching from an SSRI to an MAOI
- symptoms include nausea, diarrhea, palpitations, chills, restlessness, confusion, and lethargy but can progress to myoclonus, hyperthermia, rigor and hypertonicity
- treatment: discontinue medication and administer emergency medical care as needed
- important to distinguish from NMS (see sidebar, PS44)

## Discontinuation Syndrome

- caused by the abrupt cessation of an antidepressant
- observed most frequently with paroxetine, fluvoxamine, and venlafaxine
- symptoms usually begin within 1-3 d and include: anxiety, insomnia, irritability, mood lability, N/V, dizziness, headache, dystonia, tremor, chills, fatigue, lethargy and myalgia
- treatment: symptoms may last between 1-3 wk, but can be relieved within 24 h by restarting antidepressant therapy at the same dose the patient was taking and initiating a slow taper over several weeks
- consider drug with longer half-life such as fluoxetine

### Symptoms of Antidepressant Discontinuation

#### FINISH

Flu-like symptoms  
Insomnia  
Nausea  
Imbalance  
Sensory disturbances  
Hyperarousal (anxiety/agitation)

### Sequenced Treatment Alternatives to Relieve Depression

*Journal of Psychosocial Nursing* 2008; 46:21-24

**Study:** Prospective randomized anti-depressant treatment trial.

**Patients:** 4000 patients with major depressive disorder.

**Objective:** To compare the efficacy and tolerability of various antidepressant therapies through four sequential treatment levels.

**Intervention:** Level 1-citalopram → if relapse → Level 2-citalopram + bupropion SR, sertraline, venlafaxine XR, or cognitive psychotherapy. Level 2A-switch to bupropion or venlafaxine XR. Level 3-either mirtazapine or nortriptyline + lithium, T3. Level 4-tranylcypromine or venlafaxine XR + mirtazapine.

**Results:** Remission rates were 28% for Level 1, 17% for Level 2, 12-25% for Level 3, and 7-14% for Level 4. When more treatment steps are required, there are lower remission rates, greater degrees of tolerance, and higher rates of relapse.

Long term lithium use can lead to a nephropathy and diabetes insipidus in some patients.

### Lithium Side Effects

#### LITHIUM

Leukocytosis  
Insipidus (diabetes)  
Tremor, teratogenicity  
Hypothyroidism  
Increased weight  
"V"omiting, nausea  
Miscellaneous (e.g. ECG changes, acne)

## Mood Stabilizers

### First-Line

#### Lithium or Valproic Acid (± antipsychotic)

- before initiating, get baseline: CBC, ECG (if patient >45 yr old or cardiovascular risk), urinalysis, BUN, Cr, electrolytes, TSH
- before initiating lithium: screen for pregnancy, thyroid disease, seizure disorder, neurological, renal, cardiovascular diseases
- may need acute coverage with benzodiazepines or antipsychotics
- use carbamazepine in non-responders and rapid cycling bipolar disorder
- can combine lithium and carbamazepine or valproic acid safely in lithium non-responders
- olanzapine may be used as a mood stabilizer, in conjunction with other mood stabilizers
- lithium and lamotrigine have established antidepressant efficacy

#### Lithium Toxicity (see Table 23)

- clinical diagnosis as toxicity can occur at therapeutic levels
- **common causes**
  - overdose
  - sodium or fluid loss
  - concurrent medical illness
- **clinical presentation**
  - GI: severe nausea/vomiting and diarrhea
  - cerebellar: ataxia, slurred speech, lack of coordination
  - cerebral: drowsiness, myoclonus, choreiform or Parkinsonian movements, upper motor neuron signs, seizures, delirium, coma
- **management**
  - discontinue lithium for several doses and begin again at a lower dose when lithium level has fallen to a non-toxic range
  - serum lithium levels, BUN, electrolytes
  - saline infusion
  - hemodialysis if lithium >2 mmol/L, coma, shock, severe dehydration, failure to respond to treatment after 24 h, or deterioration

### Second-Line/Adjuvant Mood Stabilizers

Lithium, lamotrigine, divalproex, carbamazepine

**Table 23. Commonly Used Mood Stabilizers**

	<b>Lithium</b>	<b>Lamotrigine (Lamictal®)</b>	<b>Divalproex (Epival®)</b>	<b>Carbamazepine (Tegretol®)</b>
<b>Indications</b>	Maintenance therapy of bipolar disorder Treatment of acute mania Augmentation of antidepressants in MDE and OCD Schizoaffective disorder Chronic aggression and antisocial behaviour Recurrent depression	Treatment of bipolar disorder	Maintenance therapy of bipolar disorder Treatment of acute mania Rapid cycling bipolar disorder Mixed phase/Dysphoric mania	Maintenance therapy of bipolar disorder Treatment of acute mania Rapid cycling bipolar disorder
<b>Mode of Action</b>	Unknown Therapeutic response within 7-14 d	May inhibit 5-HT <sub>3</sub> receptors May potentiate DA activity	Depresses synaptic transmission Raises seizure threshold	Depresses synaptic transmission Raises seizure threshold
<b>Dosage</b>	Adult: 600-1500 mg/d Geriatric: 150-600 mg/d Usually daily dosing	Starting: 12.5-15 mg/d Daily dose: 100-200 mg/d Dose adjusted in patients taking other anticonvulsants	750-2500 mg/d Usually tid dosing	400-1600 mg/d Usually bid or tid dosing
<b>Therapeutic Level</b>	Adult: 0.5-1.2 mmol/L (1.0-1.25 mmol/L for acute mania) Geriatric: 0.3-0.8 mmol/L	Therapeutic plasma level not established Dosing based on therapeutic response	17-50 mmol/L	350-700 µmol/L
<b>Monitoring</b>	Monitor serum levels until therapeutic (always wait 12 h after dose) Then monitor biweekly or monthly until a steady state is reached, then q2mo Monitor thyroid function q6mo, creatinine q6mo, urinalysis q1yr	Monitor for suicidality, particularly when initiating treatment	LFTs weekly x 1 mo, then monthly, due to risk of liver dysfunction Watch for signs of liver dysfunction: nausea, edema, malaise	Weekly blood counts for first month, due to risk of agranulocytosis Watch for signs of blood dyscrasias: fever, rash, sore throat, easy bruising
<b>Side Effects</b>	GI: N/V, diarrhea, stomach pain GU: polyuria, polydipsia, GN, renal failure, nephrogenic DI CNS: fine tremor, lethargy, fatigue, headache Hematologic: reversible leukocytosis Other: teratogenic (Ebstein's anomaly), weight gain, edema, psoriasis, hypothyroidism, hair thinning, muscle weakness, ECG changes	GI: N/V, diarrhea CNS: ataxia, dizziness, diplopia, headache, somnolence Skin: rash (should d/c drug because of risk of Stevens-Johnson syndrome), increased lamotrigine levels = increased risk of rash Other: anxiety	GI: liver dysfunction, N/V, diarrhea CNS: ataxia, drowsiness, tremor, sedation, cognitive blurring Other: hair loss, weight gain, transient thrombocytopenia, neural tube defects when used in pregnancy	GI: N/V, diarrhea, hepatic toxicity CNS: ataxia, dizziness, slurred speech, drowsiness, confusion, nystagmus, diplopia Hematologic: transient leukopenia (10%), agranulocytosis, aplastic anemia Skin: rash (5% risk; should d/c drug because of risk of Stevens-Johnson syndrome) Other: neural tube defects when used in pregnancy
<b>Interactions</b>	NSAIDs decrease clearance		OCP	OCP

## Anxiolytics

- anxiolytics mask or alleviate symptoms; they do not cure them
- **indications**
  - short term treatment of transient forms of anxiety disorders, insomnia, alcohol withdrawal (especially delirium tremens), barbiturate withdrawal, organic brain syndrome (agitation in dementia), EPS and akathisia due to antipsychotics, seizure disorders, musculoskeletal disorders
- **relative contraindications**
  - major depression (except as an adjunct to other treatment), history of drug/alcohol abuse, pregnancy, breast feeding
- **mechanism of action**
  - benzodiazepines: potentiate binding of GABA to its receptors; results in decreased neuronal activity
  - buspirone: partial agonist of 5-HT<sub>1A</sub> receptors

### Benzodiazepines

- should be used for limited periods (weeks-months) to avoid dependence
- all benzodiazepines are sedating; be wary in use for the elderly
- have similar efficacy, so choice depends on half-life, metabolites and route of administration, OD or bid
- taper slowly over weeks-mo because they can cause withdrawal reactions
  - low dose withdrawal: tachycardia, hypertension, panic, insomnia, anxiety, impaired memory and concentration, perceptual disturbances
  - high dose withdrawal: hyperpyrexia, seizures, psychosis, death
- avoid alcohol because of potentiation of CNS depression; caution with drinking and use of machinery

- **side effects**
  - CNS: drowsiness, cognitive impairment, reduced motor coordination, memory impairment
  - physical dependence, tolerance develops
- **withdrawal**
  - symptoms: anxiety, insomnia, autonomic hyperactivity (less common)
  - onset: 1-2 d (short-acting), 2-4 d (long-acting)
  - duration: weeks/months
  - complications: above 50 mg diazepam/day: seizures, delirium, arrhythmias, psychosis
  - management: taper with long-acting benzodiazepine
  - similar to but less severe than alcohol withdrawal; can be fatal
- **overdose**
  - commonly used drug in overdose
    - ♦ overdose is rarely fatal
    - ♦ benzodiazepines are more dangerous and may cause death when combined with alcohol, other CNS depressants or TCAs

### Benzodiazepine Antagonist – Flumazenil (Anexate®)

- use for suspected benzodiazepine overdose
- specific antagonist at the benzodiazepine receptor site

### Buspirone (Buspar®)

- **primary use:** GAD
- may be preferred over benzodiazepines because:
  - non-sedating
  - no interaction with alcohol
  - does not alter seizure threshold
  - not prone to abuse
- **onset of action:** 2 wk
- **side effects:** dizziness, drowsiness, nausea, headache, nervousness, EPS

**Table 24. Common Anxiolytics**

Class	Drug	Dose Range (mg/d)	t <sub>1/2</sub> (h)	Appropriate Use
<b>Benzodiazepines</b>				
Long-acting	clonazepam (Rivotril®)	0.25-4	18-50	Akathisia, generalized anxiety, seizure prevention, panic disorder
	diazepam (Valium®)	2-40	30-100	Generalized anxiety, seizure prevention, muscle relaxant, alcohol withdrawal
	chlordiazepoxide (Librium®)	5-300	30-100	Sleep, anxiety, alcohol withdrawal
	flurazepam (Dalmane®)	15-30	50-160	Sleep
Short-acting	alprazolam (Xanax®)	0.25-4.0	6-20	Panic disorder, high dependency rate
	lorazepam (Ativan®)	0.5-6.0	10-20	Sleep, generalized anxiety, akathisia, alcohol withdrawal, sublingual available for very rapid action
	oxazepam (Serax®)	10-120	8-12	Sleep, generalized anxiety, alcohol withdrawal
	temazepam (Restoril®)	7.5-30	8-20	Sleep
	triazolam (Halcion®)	0.125-0.5	1.5-5	Shortest t <sub>1/2</sub> , rapid sleep, but rebound insomnia
<b>Azapirones</b>				
	buspirone (Buspar®)	20-60	2-11	Generalized anxiety
	zopiclone (Imovane®)	5-7.5	3.8-6.5	Sleep

#### Geriatric Benzodiazepines

##### LOT

Lorazepam  
Oxazepam  
Temazepam

Safe in liver disease because not metabolized by liver

#### Benzodiazepines used for Alcohol Withdrawal

- Diazepam 20 mg PO/IV q1h prn
- Lorazepam 2-5 mg PO/IV/SL for patients with liver disease, chronic lung disease, or elderly

#### ECT in Society

Prior to the 1940's, ECT was performed without the use of muscle relaxants, resulting in seizures with full-scale convulsions and rare but serious complications such as vertebral and long-bone fractures. This practice may have led to negative societal perceptions of ECT, further perpetuated by barbaric depictions in popular culture. Despite ongoing stigmatization, ECT as it is practiced today is an effective and safe option for patients struggling with mental illness.

## Electroconvulsive Therapy

- induction of a grand mal seizure using an electrical pulse through the brain while the patient is under general anesthesia with a muscle relaxant
- unilateral vs. bilateral electrode placement
- **indications**
  - depression refractory to adequate pharmacological trial
  - high suicide risk
  - medical risk in addition to depression (dehydration, electrolytes, pregnancy)
  - previous good response to ECT
  - familial response to ECT
  - elderly

- psychotic depression
- catatonic features
- marked vegetative features
- acute schizophrenia
- mania unresponsive to medications
- **side effects:** risk of anesthesia, memory loss (may be retrograde and/or anterograde, tends to resolve by 6 to 9 mo, permanent impairment controversial), headaches, myalgias
- evidence that unilateral ECT causes less memory loss than bilateral but may not be as effective
- **contraindications:** increased intracranial pressure

#### Efficacy of ECT in Depression: A Meta-Analytic Review

*J of ECT* 2004; 20:13-20

**Study:** Meta-analysis of randomized and non-randomized control trials.

**Patients:** Individuals with unipolar and bipolar depression.

**Methods:** MEDLINE search for relevant papers from 1966-2003.

**Main Outcomes:** The Hamilton Depression Rating scale was used to determine response to treatment.

**Results:** ECT was found to be superior to simulated ECT, placebo, TCAs, MAOIs, and anti-depressants in general.

**Summary:** ECT is an efficacious treatment modality, particularly in severe and treatment-resistant depression.

## Experimental Therapies

### Deep Brain Stimulation (DBS)

- constant electrical stimulation of neuroanatomical targets that have been identified in the biological model of depression
- areas identified include the nucleus accumbens, internal capsule and subgenual cingulate cortex
- parameters such as active electrode location, pulse width, frequency and voltage may be manipulated

### Transcranial Magnetic Stimulation (TMS)

- non-invasive magnetic stimulation of superficial neurons in the frontal cortex (main target: dorsolateral prefrontal cortex) hypothesized to normalize cortical activity in depressed patients
- meta-analyses show modest acute efficacy

### Vagal Nerve Stimulation

- an invasive surgical procedure: a battery powered pulse generator is implanted in the chest wall and connected to an electrode that is attached around one (typically the left) vagus nerve
- meta-analyses show a greater response and remission rates for treatment resistant depression if combined with usual treatment (versus usual treatment alone)
- not indicated for use in acute illness

## Canadian Legal Issues

## Common Forms

Table 25. Common Forms Under the *Mental Health Act* (in Ontario)

Form	Who Signs	When	Expiration Date	Right of Patient to Review Board Hearing	Options Before Form Expires
<b>Form 1:</b> Application by physician to hospitalize a patient for psychiatric assessment against his/her will to a schedule 1 facility (Form 42 given to patient)	Any MD	Within 7 d after examination of the patient	72 h after hospitalization Void if not implemented within 7 d	No	Form 3 or voluntary admission (Form 5) or Send home ± Follow up
<b>Form 2:</b> Order for hospitalization and medical examination against his/her will by Justice of the Peace	Justice of the Peace	No statutory time restriction	7 d from when completed Purpose of form is complete once patient brought to hospital	No	Form 1 or Send home ± Follow up
<b>Form 3:</b> Certificate of involuntary admission to a schedule 1 facility (Form 30 given to patient, notice to rights advisor)	Attending MD (different than MD who completed Form 1)	Before expiration of Form 1 Any time to change status of an involuntary patient	14 d	Yes (within 48 h)	Form 4 or Form 5

#### Form 1: Application for Psychiatric Assessment

- Filled out when a patient is suspected of being an imminent harm to themselves (suicide) or others (homicide) or when they are incapable of self-care (e.g. not dressed for freezing weather) and are suffering from an apparent mental disorder
- Based on any combination of the physician's own observations and facts communicated by others
- Box A or Box B completed
- **Box A:** Serious Harm Test
- The Past/Present Test assesses current behaviours/threats/attempts
- The Future Test assesses the likelihood of serious harm occurring as a result of the presenting mental disorder. In this section, one should document evidence of the mental disorder
- **Box B:** Patients with a known mental disorder, who are incapable of consenting to treatment (existing substitute decision-maker), have previously received treatment and improved, and are currently at risk of serious harm due to the same mental disorder

**Table 25. Common Forms Under the Mental Health Act (in Ontario)** (continued)

Form	Who Signs	When	Expiration Date	Right of Patient to Review Board Hearing	Options Before Form Expires
<b>Form 4:</b> Certificate of renewal of involuntary admission to a schedule 1 facility (Form 30 given to patient, notice to rights advisor)	Attending MD following patient on Form 3	Prior to expiration of Form 3	First: 1 mo Second: 2 mo Third: 3 mo (max)	Yes (within 48 h)	Form 4 or Form 5
<b>Form 5:</b> Change to informal/voluntary status	Attending MD following patient on Form 3/4	Whenever deemed appropriate	N/A	N/A	N/A
<b>Form 30:</b> Notice to patient on certification on Form 3 or Form 4	Attending MD	At time of completion of Form 3 or 4	N/A	Yes	N/A
<b>Form 33:</b> Notice to patient that patient is incompetent to consent to treatment of mental disorder and/or management of property	Attending MD	Whenever deemed appropriate	N/A	N/A	N/A

\* Schedule 1 Facilities: Able to provide intensive inpatient and outpatient care

## Consent

- see [Ethical, Legal and Organizational Aspects of Medicine](#), ELOAM5

## Community Treatment Order (CTO)

- known as “Brian’s Law,” Ontario passed legislature regarding CTOs on December 1, 2000
- similar CTOs have been implemented in Saskatchewan (1995), Manitoba (1997) and British Columbia (1999)
- purpose: to provide a person who suffers from a serious mental disorder with a comprehensive plan of community-based treatment and supervision that is less restrictive than being detained in a psychiatric facility
- intended for those who:
  - as a result of their serious mental disorder, experience a pattern of admission to a psychiatric facility where their condition is usually stabilized
  - after being released, these patients often lack supervision and stop treatment
  - due to the destabilization of their condition, these patients usually require re-admission to hospital
- criteria for a physician to issue a CTO
  - patient with a prior history of hospitalization
  - a community treatment plan for the person has been made
  - examination by a physician within the previous 72 h before entering into the CTO plan
  - ability of the person subject to the CTO to comply with it
  - consultation with a rights adviser and consent of the person and the person’s substitute decision maker, if any
- CTOs are valid for 6 mo unless they are renewed or terminated at an earlier date
  - where the person fails to comply with the CTO
  - when the person or his/her substitute decision-maker withdraws consent to the community treatment plan
- CTO process is consent-based and all statutory protections governing informed consent apply
- the rights of a person subject to a CTO include:
  - the right to a review by the Consent and Capacity Board with appeal to the courts each time a CTO is issued or renewed
  - a mandatory review by the Consent and Capacity Board every second time a CTO is renewed
  - the right to request a re-examination by the issuing physician to determine if the CTO is still necessary for the person to live in the community
  - the right to review findings of incapacity to consent to treatment
  - provisions for rights advice

## Duty to Inform/Warn

- see [Ethical, Legal, and Organizational Aspects of Medicine](#), ELOAM9

## Approach to the Respiratory Patient

### Basic Anatomy Review

Figure 1. Lung lobes and bronchi

#### Respiration Pattern

**Normal**

**Obstructive** (prolonged expiration)

- Asthma, COPD

**Bradypnea** (slow respiratory rate)

- Drug-induced respiratory depression
- Diabetic coma (nonketotic)
- Increased ICP

**Kussmaul's Breathing** (fast and deep)

- Metabolic acidosis
- Exercise
- Anxiety

**Biot's/Ataxic** (irregular with long apneic periods)

- Drug-induced respiratory depression
- Increased ICP
- Brain damage, especially medullary

**Cheyne-Stokes Breathing** (changing rates and depths with apneic periods)

- Drug-induced respiratory depression
- Brain damage (especially cerebral)
- CHF
- Uremia

**Apneustic** (prolonged inspiratory pause)

- Pontine lesion

© Bonnie Tang 2012

Figure 2. Respiration patterns in normal and disease states

## Differential Diagnoses of Common Presentations

Table 1. Differential Diagnosis of Dyspnea

<b>Acute dyspnea (minutes-hours)</b>
<b>Cardiac causes</b>
Ischemic heart disease
CHF exacerbation
Cardiac tamponade
<b>Pulmonary causes</b>
Upper airway obstruction (anaphylaxis, foreign body)
Airway disease (asthma, COPD exacerbation, bronchitis)
Parenchymal lung disease (ARDS, pneumonia)
Pulmonary vascular disease (PE, vasculitis)
Pleural disease (pneumothorax, tension pneumothorax)
Respiratory control (metabolic acidosis, ASA toxicity)
<b>Psychiatric</b>
Anxiety/psychosomatic
<b>Chronic dyspnea (weeks-months)</b>
<b>Cardiac causes</b>
Valvular heart disease
Decreased CO
<b>Respiratory causes</b>
Parenchymal lung disease (interstitial disease)
Pulmonary vascular disease (pulmonary HTN, vasculitis)
Pleural disease (effusion)
Airway disease – asthma, COPD
<b>Hematologic causes</b>
Severe anemia
<b>Neuromuscular and chest wall disorders</b>
Deconditioning, obesity, pregnancy, neuromuscular disease

Table 2. Differential Diagnosis of Chest Pain

(see Cardiology and Cardiovascular Surgery C4 and Emergency Medicine ER21)

<b>Nonpleuritic</b>	<b>Pleuritic</b>
<b>Pulmonary</b>	<b>Pulmonary</b>
Pneumonia	Pneumonia
PE	PE
Neoplastic	Pneumothorax
<b>Cardiac</b>	Hemothorax
MI	Neoplasm
Myocarditis/pericarditis	TB
<b>Esophageal</b>	Empyema
GERD	<b>Cardiac</b>
Spasm	Pericarditis
Esophagitis	Dressler's syndrome
Ulceration	<b>GI</b>
Achalasia	Subphrenic abscess
Neoplasm	Pancreatitis
Esophageal rupture	<b>MSK</b>
<b>Mediastinal</b>	Costochondritis
Lymphoma	Fractured rib
Thymoma	Myositis
<b>Subdiaphragmatic</b>	Herpes zoster
PUD	
Gastritis	
Biliary colic	
Pancreatitis	
<b>Vascular</b>	
Dissecting aortic aneurysm	
<b>MSK</b>	
Costochondritis	
Skin	
Breast	
Ribs	

### Most Common Causes of Chronic Cough in Healthy-Appearing Patient (cough > 3 mo with normal CXR)

- GERD
- Asthma
- Post-nasal drip
- ACEI

### Hemoptysis

- Most common cause is bronchitis
- 90% of massive hemoptysis is from the bronchial arteries
- Considered "massive" if > 600 mL/24 h

### Signs of Respiratory Distress

- Increased RR
- Nasal flaring
- Central/peripheral cyanosis
- Tracheal tug
- Inability to speak
- Accessory muscle use and tripodding
- Intercostal indrawing

Clubbing is not seen in COPD – if present, think malignancy.

Table 3. Differential Diagnosis of Hemoptysis

<b>Airway Disease</b>
Acute or chronic bronchitis
Bronchiectasis
Bronchogenic CA
Bronchial carcinoid tumour
<b>Parenchymal Disease</b>
Pneumonia
TB
Lung abscess
<b>Vascular Disease</b>
PE
Elevated pulmonary venous pressure:
LVF
Mitral stenosis
Vascular malformation
Vasculitis
Goodpasture's syndrome
Idiopathic pulmonary hemosiderosis
<b>Miscellaneous</b>
Impaired coagulation
Pulmonary endometriosis

Table 4. Differential Diagnosis of Cough

<b>Airway Irritants</b>
Inhaled smoke, dusts, fumes
Postnasal drip (upper airway cough syndrome)
<b>Aspiration</b>
Gastric contents (GERD)
Oral secretions
Foreign body
<b>Airway Disease</b>
URTI including postnasal drip and sinusitis
Acute or chronic bronchitis
Bronchiectasis
Neoplasm
External compression by node or mass lesion
Asthma
COPD
<b>Parenchymal Disease</b>
Pneumonia
Lung abscess
Interstitial lung disease
<b>CHF</b>
<b>Drug-induced (e.g. ACEI)</b>

Adapted from Principles of Pulmonary Medicine, 5th edition, SE Weinberger, Copyright (2008), with permission from Elsevier

Table 5. Differential Diagnosis of Clubbing

<b>Pulmonary</b>	<b>Gastrointestinal</b>	<b>Mediastinal</b>
Cystic fibrosis	IBD (UC, CD)	Esophageal CA
Pulmonary fibrosis	Chronic infections	Thymoma
Chronic pus in the lung (bronchiectasis, abscess, infections, etc.)	Laxative abuse	<b>Other</b>
Lung CA (primary or mets)	Polyposis	Grave's Disease
A-V fistula	Malignant tumours	Thalassemia
Solitary fibrous tumour of pleura	Cirrhosis	Other malignancies
	Hepatocellular carcinoma	Primary hypertrophic osteoarthropathy
	<b>Cardiac</b>	
	Cyanotic congenital heart disease	
	Infective endocarditis	

Figure 3. Three signs of clubbing

1. Profile Angle ( $ABC > 176^\circ$ )
  2. Hyponychial Angle ( $ABD > 192^\circ$ )
  3. Phalangeal Depth Ratio ( $DPD:IPD > 1$ )
- Adapted from JAMA 2001;286:341-347

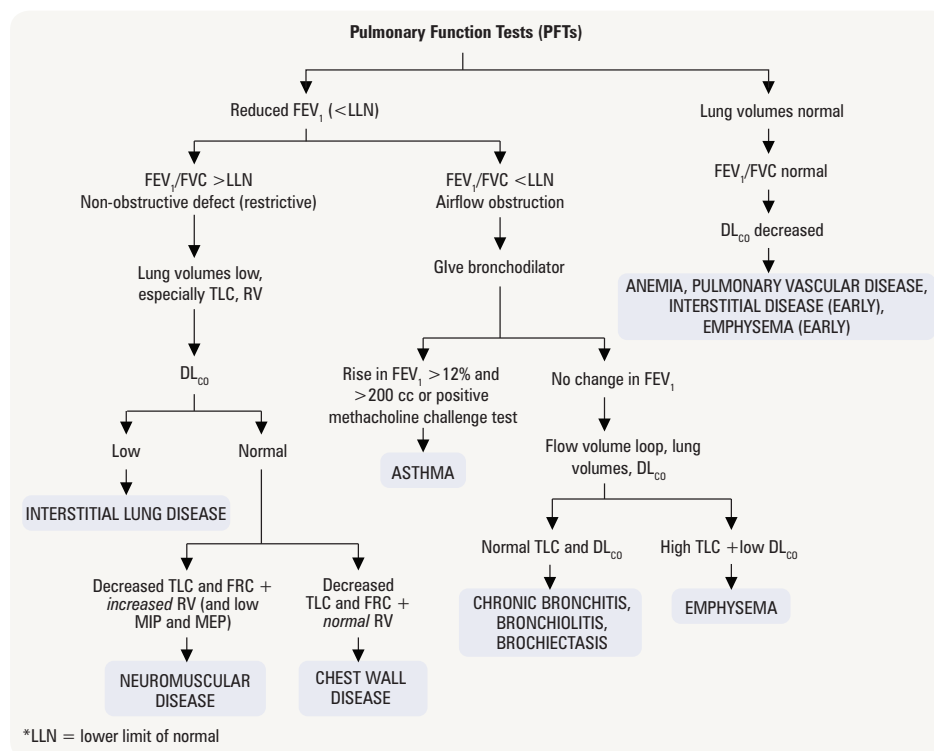

## Pulmonary Function Tests (PFTs)

- useful in differentiating the pattern of lung disease (obstructive vs. restrictive) (Table 6)
- assess lung volumes, flow rates, and diffusion capacity (see Figures 4a and 4b)
- **note:** normal values for FEV<sub>1</sub> are approximately  $\pm 20\%$  of the predicted values (for age, sex and height); ethnicity may affect predicted values

**Table 6. Comparison of Lung Flow and Volume Parameters in Obstructive vs. Restrictive Lung Disease**

	Obstructive	Restrictive
	<ul style="list-style-type: none"> <li>Decreased flow rates (most marked during expiration)</li> <li>Air trapping (increased RV/TLC)</li> <li>Hyperinflation (increased FRC, TLC)</li> </ul>	<ul style="list-style-type: none"> <li>Decreased lung compliance</li> <li>Decreased lung volumes</li> </ul>
DDx	Asthma, COPD, CF, bronchiolitis, bronchiectasis*	ILD, pleural disease, neuromuscular disease, chest wall disease
FEV <sub>1</sub> /FVC	↓	↑ or N
TLC	↑ or N	↓
RV	↑ or N	↓
RV/TLC	↑ or N	N
DL <sub>CO</sub>	↓ or N	↓ or N

\*Bronchiectasis can be obstructive or mixed

### Figure 5. Interpreting PFTs

## Chest X-Rays

- see also [Medical Imaging](#), MI4

### Table 7. CXR Patterns and Differential Diagnosis

Pattern	Signs	Common DDx
<b>Consolidation</b> ("Airspace disease")	Air bronchogram Silhouette sign Less visible blood vessels	<u>Acute</u> : water (pulmonary edema), pus (pneumonia), blood (hemorrhage) <u>Chronic</u> : neoplasm (lymphoma), inflammatory (eosinophilic pneumonia), chronic infection (TB, fungal)
<b>Reticular</b> ("Interstitial disease")	Increased pulmonary markings Honeycombing (IPF)	ILD (IPF, collagen vascular disease, asbestos, drugs)
<b>Nodular</b>	Cavitary vs. non-cavitary	<u>Cavitary</u> : neoplasm (primary vs. metastatic lung cancer), infectious (anaerobic or Gram negative, TB, fungal), inflammatory [RA, Granulomatosis with Polyangiitis (GPA)] <u>Non-cavitary</u> : above + sarcoid, Kaposi's sarcoma (in HIV), silicosis and other pneumoconiosis

### Figure 4A. Subcompartments of lung volumes

**Figure 4B. Expiratory flow volume curves**

Adapted with permission from Elsevier. Weinberger SE.  
Principles of pulmonary medicine, 5th ed. ©2008

**Plethysmography:** involves the use of a plethysmograph (or "body box") and used to measure FRC. After a normal expiration the patient inhales against a closed mouthpiece. Resultant changes in the volume and pressure of the plethysmograph are used to calculate the volume of gas in the thorax. Useful for patients with air trapping since all air in the thoracic cavity is determined by the calculation.

**He dilution:** used to measure FRC by diluting a known amount of helium into a patient's lungs following inspiration. Since the amount of helium remains constant, FRC is determined based on the final concentration of the helium in the closed system. Only includes airspaces that communicate with the bronchial tree.

**Bronchoscopy:** a flexible or rigid bronchoscope is used for visualization of a patient's airways for diagnostic and therapeutic indications. It is used to obtain tissue washings for culture and cytology, endobronchial or transbronchial tissue biopsies, remove secretions/foreign bodies/blood, laser resections, airway stenting, etc. Mediastinal lymph nodes can also be sampled using a special bronchoscope equipped with an US probe (EBUS).

### Lung Volumes

ERV – Expiratory Reserve Volume  
 FEF – Forced Expiratory Flow Rate  
 FEV<sub>1</sub> – Forced Expiratory Volume  
           (in one second)  
 FRC – Functional Residual Capacity  
 IC – Inspiratory Capacity  
 RV – Residual Volume  
 TLC – Total Lung Capacity  
 VC – Vital Capacity  
 V<sub>T</sub> – Tidal Volume

## Arterial Blood Gases

- provides information on acid-base and oxygenation status
- see also [Nephrology](#), NP14

### Approach to Acid-Base Status

1. Is the pH acidemic (pH <7.35), alkalemic (pH >7.45), or normal (pH 7.35-7.45)?
2. What is the primary disturbance?
  - metabolic: change in  $\text{HCO}_3^-$  and pH in same direction
  - respiratory: change in  $\text{HCO}_3^-$  and pH in opposite direction
3. Is there appropriate compensation? (Table 8)
  - metabolic compensation occurs over 2-3 d reflecting altered renal  $\text{HCO}_3^-$  production and excretion
  - respiratory compensation through ventilatory control of  $\text{P}_a\text{CO}_2$  occurs immediately
  - inadequate compensation may indicate a second acid-base disorder

**Table 8. Expected Compensation for Specific Acid-Base Disorders**

Disturbance	$\text{P}_a\text{CO}_2$ (mmHg) (normal ~40)	$\text{HCO}_3^-$ (mmHg) (normal ~24)
<b>Respiratory Acidosis</b>		
Acute	↑ 10	↑ 1
Chronic	↑ 10	↑ 3
<b>Respiratory Alkalosis</b>		
Acute	↓ 10	↓ 2
Chronic	↓ 10	↓ 5
<b>Metabolic Acidosis</b>	↓ 1	↓ 1
<b>Metabolic Alkalosis</b>	↑ 5-7	↑ 10

4. If there is metabolic acidosis, what is the anion gap and osmolar gap?
  - anion gap =  $[\text{Na}^+] - ([\text{Cl}^-] + [\text{HCO}_3^-])$ ; normal ≤10-15 mmol/L
  - osmolar gap = measured osmolarity – calculated osmolarity = measured –  $(2[\text{Na}^+] + \text{glucose} + \text{urea})$ ; normal ≤10
5. If anion gap is increased, is the change in bicarbonate the same as the change in anion gap?
  - if not, consider a mixed metabolic picture

**Table 9. Differential Diagnosis of Respiratory Acidosis**

*Increased  $\text{P}_a\text{CO}_2$  secondary to hypoventilation*

#### Respiratory centre depression (decreased RR)

Drugs (anesthesia, sedatives, narcotics)  
Trauma  
Increased ICP  
Encephalitis  
Stroke  
Central apnea  
Supplemental  $\text{O}_2$  in chronic  $\text{CO}_2$  retainers (i.e. COPD)

#### Neuromuscular disorders (decreased vital capacity)

Myasthenia gravis  
Guillain-Barré syndrome  
Poliomyelitis  
Muscular dystrophies  
ALS  
Myopathies  
Chest wall disease (obesity, kyphoscoliosis)

#### Airway obstruction (asthma, COPD)

#### Parenchymal disease

COPD  
Pulmonary edema  
Pneumothorax  
Pneumonia  
ILD (late stage)  
ARDS

#### Mechanical hypoventilation (inadequate mechanical ventilation)

**Table 10. Differential Diagnosis of Respiratory Alkalosis**

*Decreased  $\text{P}_a\text{CO}_2$  secondary to hyperventilation*

#### Hypoxemia

Pulmonary disease (pneumonia, edema, PE, interstitial fibrosis)  
Severe anemia  
Heart failure  
High altitude

#### Respiratory centre stimulation

CNS disorders  
Hepatic failure  
Gram-negative sepsis  
Drugs (ASA, progesterone, theophylline, catecholamines, psychotropics)  
Pregnancy  
Anxiety  
Pain

#### Mechanical hyperventilation (excessive mechanical ventilation)

### Diffusion Capacity for Carbon Monoxide ( $\text{DL}_{\text{CO}}$ )

#### $\text{DL}_{\text{CO}}$ decreases with:

- Decreased surface area (e.g. emphysema)
- Decreased hemoglobin
- Interstitial lung disease
- Pulmonary vascular disease

#### $\text{DL}_{\text{CO}}$ increases with:

- Asthma
- Pulmonary hemorrhage
- Polycythemia
- Increased pulmonary blood volume

OG = measured osmolarity – calculated osmolarity; for calculated osmolarity think "2 salts and a sticky BUN" ( $2\text{Na}^+ + \text{glucose} + \text{urea}$ )

Note: Mixed acid-base disturbances can still have a "normal pH"

### Ventilation Failure: Think "Can't Breathe" vs. "Won't Breathe" (increased $\text{P}_a\text{CO}_2$ )

#### Can't Breathe

- Neuromuscular disorders
- Airway obstruction
- Parenchymal disease

#### Won't Breathe

- Respiratory centre depression
- Hypothyroidism
- Sleep apnea (central)

### Anion Gap Metabolic Acidosis

#### KARME

Ketoacidosis  
ASA  
Renal failure (uremia)  
Methanol  
Ethylene glycol  
Lactic acidosis

#### MUDPILES

Methanol  
Uremia  
Diabetic ketoacidosis/starvation ketoacidosis  
Phenformin/Paraldehyde  
Isoniazid, Iron, Ibuprofen  
Lactate  
Ethylene glycol  
Salicylates  
Cyanide, Carbon dioxide  
Alcoholic ketoacidosis  
Toluene, Theophylline

Acidosis ↔ Hyperkalemia  
Alkalosis ↔ Hypokalemia

- see [Nephrology](#), NP14 for differential diagnosis of metabolic acidosis and alkalosis

## Approach to Hypoxemia

1.  $P_aO_2$ : What is the arterial oxygen tension? (Measured by ABG. Normal = 95-100 mmHg)
2. A-a $DO_2$ : What is the oxygen gradient between alveoli and pulmonary capillaries? (Calculate. See sidebar. Normal <15 mmHg but increases with age)
3. What is the cause of the hypoxemia? (see Figure 7)

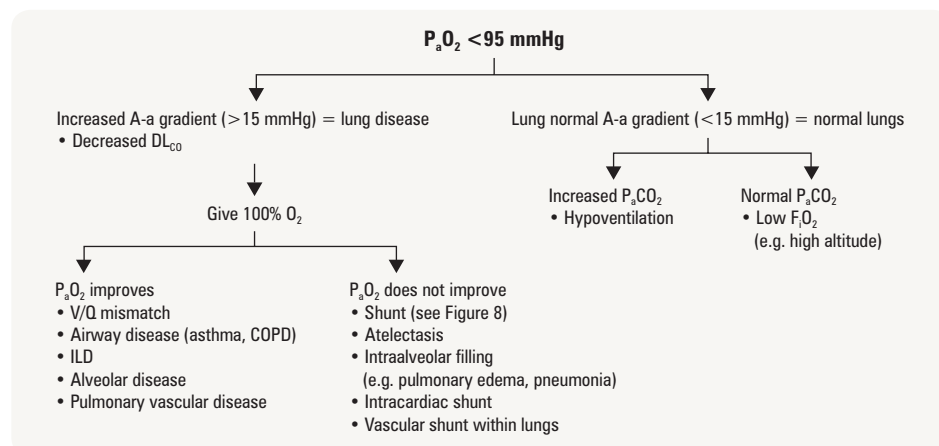

Figure 7. Approach to hypoxemia

Figure 8. Pathophysiology of shunt

### ABG Normal Values

pH 7.35-7.45  
 $HCO_3^-$  22-26 mEq/L  
 $P_aCO_2$  35-45 mm Hg  
 $P_aO_2$  80-100 mm Hg

### A-a $DO_2$ Gradient Calculation

$= P_aO_2 \text{ (alveolar)} - P_aO_2 \text{ (arterial)}$   
 $= [F_iO_2 (P_{atm} - PH_2O) - (P_aCO_2/RQ)] - P_aO_2$

### At Sea Level on Room Air

$FiO_2 = 0.21$   
 $P_{atm} = 760$  mmHg  
 $PH_2O = 47$  mmHg  
 $RQ = 0.8$   
 Thus, A-a $DO_2$  Gradient on Room Air  
 $A-aDO_2 = \{150 - 1.25 (P_aCO_2)\} - P_aO_2$

Figure 6. Oxygen-Hb dissociation curve

### Pulmonary Shunt

Occurs when the capillary networks of the alveoli are perfused, yet there is a lack of adequate ventilation (and thus oxygenation) in that alveolus or group of alveoli. Thus this blood enters the pulmonary venous system without being oxygenated.

### Factors that shift the Oxygen-Hb Dissociation curve to the right

"CADET, face right!"

$CO_2$   
 Acid  
 2,3-DPG  
 Exercise  
 Temperature

## Diseases of Airway Obstruction

### Pneumonia

- see [Infectious Diseases](#), ID8

### Asthma

- see also [Family Medicine](#), FM16 and [Pediatrics](#), P94

### Definition

- chronic inflammatory disorder of the airways resulting in episodes of reversible bronchospasm causing airflow obstruction
- associated with reversible airflow limitation and airway hyper-responsiveness to endogenous or exogenous stimuli

### Epidemiology

- common, 7-10% of adults, 10-15% of children
- most children with asthma significantly improve in adolescence
- often family history of atopy (asthma, allergic rhinitis, eczema)
- occupational asthma (organic allergies, isocyanates, animals, etc.)

## Pathophysiology

- airway obstruction  $\rightarrow$  V/Q mismatch  $\rightarrow$  hypoxemia  $\rightarrow$   $\uparrow$  ventilation  $\rightarrow$   $\downarrow$   $P_a\text{CO}_2 \rightarrow \uparrow$  pH and muscle fatigue  $\rightarrow$   $\downarrow$  ventilation,  $\uparrow$   $P_a\text{CO}_2/\downarrow$  pH

## Triggers

- URTIs, allergens (pet dander, house dust, moulds), irritants (cigarette smoke, air pollution), drugs (NSAIDs,  $\beta$ -blockers), preservatives (sulphites, MSG), other (emotion/anxiety, cold air, exercise, GERD)

## Signs and Symptoms

- dyspnea, wheezing, chest tightness, cough (especially nocturnal), sputum
- symptoms can be paroxysmal or persistent
- signs of respiratory distress (see sidebar R3)
- pulsus paradoxus

**Table 11. Criteria for Determining if Asthma is Well Controlled**

Daytime symptoms <4 d/wk	No asthma-related absence from work/school
Night-time symptoms <1 night/wk	$\beta_2$ -agonist use <4 times/wk
Physical activity normal	FEV <sub>1</sub> or PEF >90% of personal best
Exacerbations mild, infrequent	PEF diurnal variation <10-15%

Adapted from Can Respir J 2012; 19:127-164

## Investigations

- O<sub>2</sub> saturation
- ABGs (consider in acute exacerbation, along with peak flows, in Emergency Department)
  - decreased  $P_a\text{O}_2$  during attack (V/Q mismatch)
    - decreased  $P_a\text{CO}_2$  in mild asthma (hyperventilation)
    - normal or increased  $P_a\text{CO}_2$  is an ominous sign: patient is no longer able to hyperventilate (worsened airway obstruction or respiratory muscle fatigue)
- PFTs (do when stable) (see Table 12)

**Table 12. Pulmonary Function Criteria for Diagnosis of Asthma**

Preferred Measurement	Alternative Measurements
<b>Spirometry Showing Reversible Airway Obstruction</b> (1) $\downarrow$ FEV <sub>1</sub> /FVC below lower limit of normal (<0.75 to 0.8 in adults, <0.8-0.9 in children age 6+)	<b>Peak Expiratory Flow Variability</b> (1) $\uparrow$ in PEF after a bronchodilator or course of controller therapy <ul style="list-style-type: none"> <li>Adults: PEF <math>\uparrow</math> 60 L/min (min. 20%) OR Diurnal variation &gt;8% for twice daily readings (20% for multiple daily readings)</li> <li>Children age 6+: PEF <math>\uparrow</math> 20%</li> </ul>
AND  (2) $\uparrow$ FEV <sub>1</sub> $\geq$ 12% (min. 200 mL in adults) after bronchodilator or controller therapy	<b>Positive Challenge Test</b> (1) Methacholine challenge: PC <sub>20</sub> <4 mg/mL (4-16 mg/mL is borderline; >16 mg/mL is negative) OR (2) Post-exercise: $\downarrow$ FEV <sub>1</sub> $\geq$ 10-15%

Adapted from Can Respir J 2012; 19:127-164

## Treatment

- environment: avoid triggers
- patient education: features of the disease, goals of treatment, self-monitoring
- pharmacological
  - symptomatic relief in acute episodes: short-acting  $\beta_2$ -agonist, anticholinergic bronchodilators, oral steroids, addition of a long acting  $\beta_2$ -agonist
  - long-term prevention: inhaled/oral corticosteroids, anti-allergic agents, long-acting  $\beta_2$ -agonists, methylxanthine, LTRA, anti-IgE antibodies (e.g. Xolair®)

### Airway Obstruction (decreased FEV<sub>1</sub>)

- Asthma
- COPD (chronic bronchitis, emphysema)
- Bronchiectasis
- Cystic fibrosis

### Red Flags

Severe tachypnea/tachycardia, respiratory muscle fatigue, diminished expiratory effort, cyanosis, silent chest, decreased LOC.

Central cyanosis is not detectable until SaO<sub>2</sub> is <85%. It is more easily detected in polycythemia and less readily detectable in anemia.

### Aspirin®-Exacerbated Respiratory Disease (AERD, formerly Samter's Triad)

- Asthma
- ASA/NSAID sensitivity
- Nasal polyps
- Chronic hyperplastic sinusitis

### Asthma Action Plan

Is a written plan developed by patients and their physicians which includes signs and symptoms for patients to recognize their current level of respiratory distress (denoted as 'green', 'yellow' or 'red/emergency' zones) and the personalized treatment options for each zone.

## Guidelines for Asthma Management

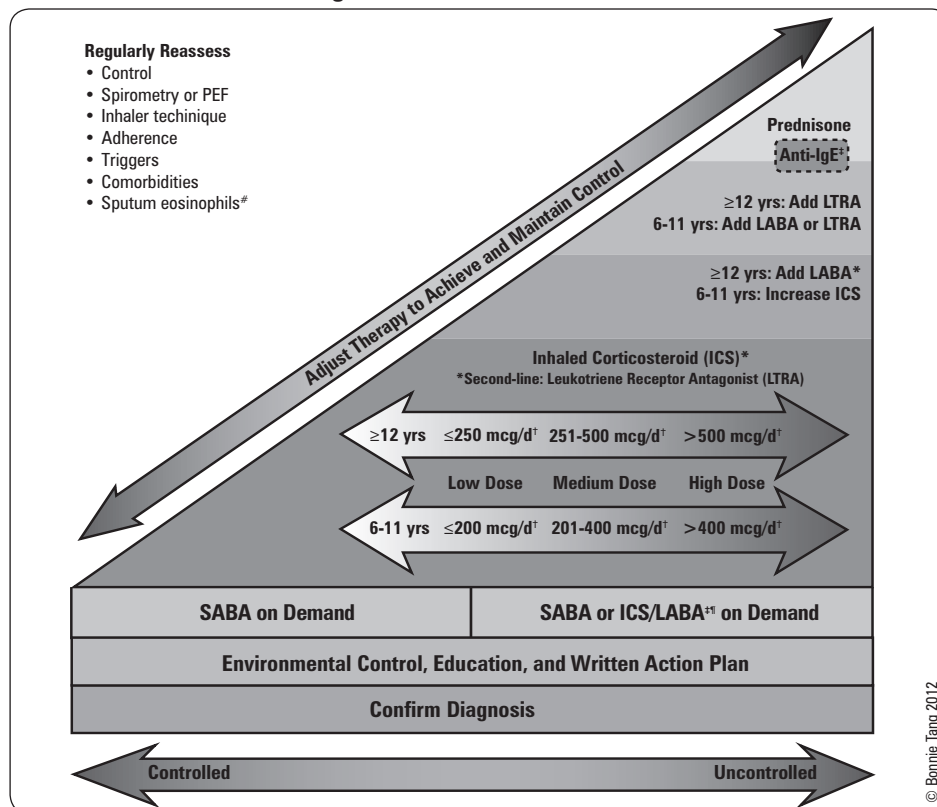

Figure 9. Guidelines for asthma management

†HFA Beclothemason or equivalent; \*Second-line: LTRA; ‡Approved for 12 yr and over; †Using a formulation approved for use as a reliever; #In adults 18 yr and older with moderate to severe asthma

Adapted from Can Respir J 2012;19:127-164

Emergency Management of Asthma (see also [Emergency Medicine](#), ER30)

- inhaled  $\beta_2$ -agonist first line (MDI route and spacer device recommended)
- systemic steroids (PO or IV, if severe)
- add anticholinergic therapy  $\pm$  magnesium sulphate
- rapid sequence intubation in life-threatening cases (plus 100% O<sub>2</sub>, monitors, IV access)
- SC/IV adrenaline, IV salbutamol if unresponsive
- corticosteroid therapy at discharge

## Chronic Obstructive Pulmonary Disease (COPD)

- see also [Family Medicine](#), FM16

## Definition

- progressive, and irreversible condition of the lung characterized by chronic obstruction to airflow with many patients having periodic exacerbations, gas trapping, lung hyperinflation and weight loss
- 2 subtypes (chronic bronchitis or emphysema): usually coexist to variable degrees
- gradual decrease in FEV<sub>1</sub> over time with episodes of acute exacerbations

Table 13. Clinical and Pathologic Features of COPD\*

Chronic Bronchitis	Emphysema
<b>Defined clinically:</b> Productive cough on most days for at least 3 consecutive months in 2 successive years Obstruction is due to narrowing of the airway lumen by mucosal thickening and excess mucus	<b>Defined pathologically:</b> Dilation and destruction of air spaces distal to the terminal bronchiole without obvious fibrosis Decreased elastic recoil of lung parenchyma causes decreased expiratory driving pressure, airway collapse, and air trapping
	<b>2 types:</b> 1) <b>Centriacinar</b> (respiratory bronchioles predominantly affected) • Typical form seen in smokers, primarily affects upper lung zones 2) <b>Panacinar</b> (respiratory bronchioles, alveolar ducts, and alveolar sacs affected) • Accounts for about 1% of emphysema cases • $\alpha_1$ -antitrypsin deficiency, primarily affects lower lobes

\*Note that both chronic bronchitis and emphysema can exist without obstruction. Only if obstruction is also present is it termed COPD

Consider LABA for night-time symptoms.

## LTRA in Addition to Usual Care for Acute Asthma in Adults and Children

Cochrane DB Syst Rev 2012;CD006100

**Purpose:** To determine if the addition of LTRA is beneficial to patients with acute asthma receiving inhaled bronchodilators and systemic corticosteroids.

**Methods:** RCTs in Cochrane Airway Group's Specialised Register of trials that compared LTRA and standard acute asthma versus placebo and standard care in people with acute asthma of any age were included.

**Results:** 8 trials, 1470 adults and 470 children. For oral treatment, no significant difference between LTRAs and control in hospital admission (RR 0.86; 95%CI 0.21 to 3.52) or requirement for additional care (RR 0.87; 95%CI 0.60 to 1.68). LTRAs improved FEV<sub>1</sub> in adults (mean difference 0.08; 95%CI 0.01 to 0.14) but not in children. No significant difference in adverse events between LTRAs and control (RR 0.81; 95%CI 0.22 to 2.99). Similar results were found for intravenous treatment

**Conclusions:** Currently, there is no evidence to support routine use of LTRAs in acute asthma.

## Natural Progression of COPD

- 40s** Chronic productive cough, wheezing occasionally
- 50s** 1<sup>st</sup> acute chest illness
- 60s** Dyspnea on exertion, increasing sputum, more frequent exacerbations
- Late Stage** Hypoxemia with cyanosis, polycythemia, hypercapnia (morning headache), cor pulmonale, weight loss

Remember, first line therapy for COPD is smoking cessation

**Risk Factors**

- smoking is #1 risk factor
- others:
  - environmental: air pollution, occupational exposure, exposure to wood smoke or other biomass fuel for cooking
  - treatable factors:  $\alpha_1$ -antitrypsin deficiency, bronchial hyperactivity
  - demographic factors: age, family history, male sex, history of childhood respiratory infections, low socioeconomic status

**Signs and Symptoms****Table 14. Clinical Presentation and Investigations for Chronic Bronchitis and Emphysema**

	Symptoms	Signs	Investigations
<b>Bronchitis (Blue Bloater*)</b>	Chronic productive cough Purulent sputum Hemoptysis Mild dyspnea initially	Cyanosis (2° to hypoxemia and hypercapnia) Peripheral edema from RVF (cor pulmonale) Crackles, wheezes Prolonged expiration if obstructive Frequently obese	<b>PFT:</b> ↓ FEV <sub>1</sub> , ↓ FEV <sub>1</sub> /FVC N TLC, ↓ or N DL <sub>CO</sub> <b>CXR:</b> AP diameter normal ↑ bronchovascular markings Enlarged heart with cor pulmonale
<b>Emphysema (Pink Puffer*)</b>	Dyspnea (± exertion) Minimal cough Tachypnea Decreased exercise tolerance	Pink skin Pursed-lip breathing Accessory muscle use Cachectic appearance due to anorexia and increased work of breathing Hyperinflation/barrel chest, hyperresonant percussion Decreased breath sounds Decreased diaphragmatic excursion	<b>PFT:</b> ↓ FEV <sub>1</sub> , ↓ FEV <sub>1</sub> /FVC ↑ TLC (hyperinflation) ↑ RV (gas trapping) ↓ DL <sub>CO</sub> <b>CXR:</b> ↑ AP diameter Flat hemidiaphragm (on lateral CXR) ↓ heart shadow ↑ retrosternal space Bullae ↓ peripheral vascular markings

\*Note that the distinction between "blue bloaters" and "pink puffers" is more of historical than practical interest as most COPD patients have elements of both

**Table 15. Treatment of Stable COPD**

Treatment	Details
<b>PROLONG SURVIVAL</b>	
Smoking cessation	Nicotine replacement, bupropion, varenicline
Vaccination	Influenza, pneumococcal vaccine
Home oxygen	Prevents cor pulmonale and decreases mortality if used >15h/d; indicated if (1) P <sub>a</sub> O <sub>2</sub> <55 mmHg or (2) <60 mmHg with cor pulmonale or polycythemia
<b>SYMPTOMATIC RELIEF</b> (no mortality benefit)	
Bronchodilators (mainstay of current drug therapy, used in combination)	<p>Short-acting anticholinergics (e.g. ipratropium bromide) and short-acting <math>\beta_2</math>-agonists (e.g. salbutamol, terbutaline)</p> <ul style="list-style-type: none"> <li>• SABAs: rapid onset but significant side effects at high doses (e.g. hypokalemia)</li> <li>• Short-acting anticholinergics more effective than SABAs with fewer side effects but slower onset; take regularly rather than PRN</li> </ul> <p>LABAs (e.g. salmeterol, formoterol, indacaterol) and long-acting anticholinergics (e.g. tiotropium bromide, glycopyrronium bromide)</p> <ul style="list-style-type: none"> <li>• More sustained effects for moderate to severe COPD</li> </ul> <p>Inhaled corticosteroid (ICS) + LABA combination (e.g. Advair®: fluticasone + salmeterol, Symbicort®: budesonide + formoterol)</p> <ul style="list-style-type: none"> <li>• ICS/LABA increases effectiveness vs. LABA alone</li> </ul> <p>Theophylline: weak bronchodilator; limited evidence to suggest combination with bronchodilator</p> <ul style="list-style-type: none"> <li>• Side effects: nervous tremor, nausea/vomiting/diarrhea, tachycardia, arrhythmias, sleep changes</li> </ul> <p>PDE4 inhibitor: roflumilast (Daxas®) – weak bronchodilator</p>
Corticosteroids	ICS monotherapy is contraindicated and ICS should only be used with a LABA in combination in patients with a history of exacerbations COPD airways are usually inflamed but often not responsive to steroids, therefore avoid chronic systemic glucocorticoids (although oral steroids are very important when treating exacerbations)
Surgical	Lung volume reduction surgery (resection of emphysematous parts of lung, associated with higher mortality if FEV <sub>1</sub> <20%), lung transplant Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance
Other	Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance

 **$\alpha_1$ -Antitrypsin Deficiency**

Inherited disorder of defective production of  $\alpha_1$ -antitrypsin, a protein produced by hepatocytes. Acts in the alveolar tissue by inhibiting the action of proteases from destroying alveolar tissue. When deficient, proteases can destroy lung alveoli resulting in emphysema.

**CO<sub>2</sub> Retainers**

On ABG, retainers have chronically elevated CO<sub>2</sub> levels with a normal pH. Maintain O<sub>2</sub> Sat between 88-92% to prevent Haldane effect and decreased respiratory drive.

**Pulmonary Embolism in Patients with Unexplained Exacerbation of COPD: Prevalence and Risk Factors**

*Ann Intern Med* 2006;144:390-396

**Study:** Prospective cohort study of 211 patients with COPD (all current and former smokers) admitted to hospital for severe COPD exacerbation of unknown origin.

**Measurements:** All patients received spiral CT angiogram (CTA) and venous compression ultrasonography of both legs.

**Results:** 25% of patients met diagnostic criteria for PE (+ CTA or + U/S).

**Conclusions:** Prevalence of PE in patients hospitalized for COPD exacerbation of unknown origin is 25%. Therefore, all patients presenting to hospital with COPD exacerbation without obvious cause require PE workup (leg dopplers or CTA – decision of which to use depends on pre-test probability of the patient).

**Non-invasive Positive Pressure Ventilation for Treatment of Respiratory Failure due to Exacerbations of COPD**

*Cochrane DB Syst Rev* 2004;CD004104

**Study:** Cochrane Systematic Review. 14 RCTs.

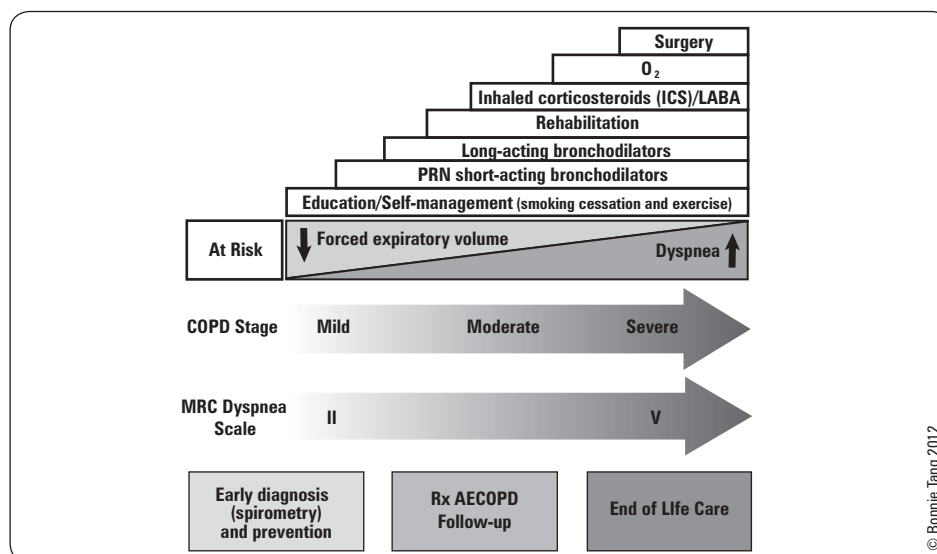

**Population:** 758 adult patients with COPD and acute respiratory failure due to COPD exacerbation.

**Intervention:** Usual medical care (UMC) and Non-invasive positive ventilation (NPPV) versus UMC alone.

**Primary Outcome:** Treatment failure, mortality, and tracheal intubation.

**Results:** The risks for all primary outcomes were reduced with NPPV use: treatment failure (RR 0.48); mortality (RR 0.52); and intubation use (RR 0.61). Length of hospital stay was a significant mean 3.24 d shorter, but no difference between ICU length of stay. There is a small and significant improvement in pH (weight mean difference (WMD)=0.04), P<sub>a</sub>CO<sub>2</sub> (WMD=0.40 kPa), and respiratory rate (WMD=-3.08 bpm) within 1 h post-treatment with NPPV. Complications associated with treatment were reduced in the NPPV treatment arm (RR 0.38).

**Conclusion:** For patients in respiratory failure due to a COPD exacerbation, NPPV is effective in reducing treatment failure, mortality, and need for intubation when used as a first time treatment adjunct to UMC.

**Figure 10. Guidelines for COPD management**

Adapted from Canadian Thoracic Society recommendations for management of chronic obstructive pulmonary disease. Can Respir J 2008;(Suppl A):15

### Acute Exacerbations of COPD

#### • definition

- sustained (>24-48 h) worsening of dyspnea, cough, or sputum production leading to an increased use of medications

#### • etiology: viral URTI, bacteria, air pollution, CHF, PE, MI must be considered

#### • management

- ABCs, consider assisted ventilation if decreasing LOC or poor ABGs
- O<sub>2</sub>: target 88-92% SaO<sub>2</sub> for CO<sub>2</sub> retainers
- bronchodilators by MDI with spacer or nebulizer
  - ♦ SABA + anticholinergic, e.g. salbutamol and ipratropium bromide via nebulizers x 3 back-to-back
- systemic corticosteroids: IV solumedrol or oral prednisone
- antibiotics if purulent sputum
  - ♦ simple exacerbation (no risk factors): amoxicillin, 2<sup>nd</sup> or 3<sup>rd</sup> generation cephalosporin, macrolide, or TMP/SMX
  - ♦ complicated exacerbation (one of: FEV<sub>1</sub> ≤50% predicted, ≥4 exacerbations per year, ischemic heart disease, home O<sub>2</sub> use, chronic oral steroid use): fluoroquinolone or β-lactam + β-lactamase inhibitor (amoxicillin/clavulanate)
- post exacerbation: rehabilitation with general conditioning to improve exercise tolerance

#### • ICU admission

- for life threatening exacerbations
- ventilatory support
  - ♦ non-invasive: NPPV, BiPAP
  - ♦ conventional mechanical ventilation

### Prognosis in COPD

#### • prognostic factors

- level of dyspnea is the single best predictor
- development of complications, e.g. hypoxemia or cor pulmonale

#### • 5-yr survival

- FEV<sub>1</sub> <1 L = 50%
- FEV<sub>1</sub> <0.75 L = 33%

#### • BODE index for risk of death in COPD

- greater score = higher probability the patient will die from COPD; score can also be used to predict hospitalization
- 10 point index consisting of four factors:
  - ♦ Body mass index (BMI): <21 (+1 point)
  - ♦ Obstruction (FEV<sub>1</sub>): 50-64% (+1), 36-49% (+2), <35% (+3)
  - ♦ Dyspnea (MRC scale): walks slower than people of same age on level surface, stops occasionally (+1), stops at 100 yards or a few minutes on the level (+2), too breathless to leave house or breathless when dressing/undressing (+3)
  - ♦ Exercise capacity (6 minute walk distance): 250-349 m (+1), 150-249 m (+2), <149 m (+3)

Remember to step down therapy to lowest doses which control symptoms/signs of bronchoconstriction.

#### Complications of COPD

- Polycythemia 2° to hypoxemia
- Chronic hypoxemia
- Pulmonary HTN from vasoconstriction
- Cor pulmonale
- Pneumothorax due to rupture of emphysematous bullae

#### Influenza Vaccine for Patients with Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2006;1:CD002733

**Study:** Cochrane Systematic Review. 11 RCTs included, 6 specifically in COPD patients.

**Population:** 6 of the studies were done on COPD patients in particular, while the others were on elderly and high-risk individuals. Asthma patients were excluded.

**Intervention:** Live or inactivated virus vaccines vs. placebo.

**Outcome:** Exacerbation rates, hospitalizations, mortality, lung function and adverse effects.

**Results:** In patients with COPD, inactivated vaccine correlated with fewer exacerbations per vaccinated subject than placebo (Weighted mean difference (WMD) -0.37, 95% 0.64 to -0.11). Inactivated vaccine resulted in fewer influenza-related infections than placebo (WMD 0.19, 95% 0.07-0.49). There was also an increased risk of local mild, transient adverse reactions with the vaccine.

**Conclusions:** There appears to be a reduction in influenza related infections, as well as exacerbations in patients with COPD receiving the vaccine.

#### Systemic Corticosteroids for Acute Exacerbations of Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2009;1:CD001288

**Study:** Cochrane Systematic Review. 10 RCTs contributed data for analysis.

**Population:** 1051 total patients with COPD experiencing acute exacerbations.

**Intervention:** Oral or parenteral corticosteroids vs. placebo.

**Outcome:** Rate of treatment failure, length of hospitalization, FEV<sub>1</sub>.

**Results:** Patients receiving corticosteroids experienced fewer treatment failures than placebo (OR 0.50, 95% 0.36-0.69). The length of stay in hospital was shorter in patients receiving steroids (-1.22 d, 95% -2.26 to -0.18). There was also an improvement in FEV<sub>1</sub> at 72 h (140 mL, 95% 90-190) and at end of treatment (up to 15 d) (80 mL, 95% 10-160). The risk of hypoglycemia was increased (OR 4.95, 95% 2.47-9.91).

**Conclusions:** There appears to be a reduction in rate of treatment failure, reduced length of hospitalization and improved FEV<sub>1</sub> in patients receiving corticosteroid treatment for an acute exacerbation of COPD. However, there is also an increase in significant adverse effects. The ideal length of treatment remains controversial.

## Bronchiectasis

### Definition

- irreversible dilatation of airways due to inflammatory destruction of airway walls resulting from persistently infected mucus
- usually affects medium sized airways
- P. aeruginosa* is the most common pathogen; *S. aureus*, *H. influenzae* and nontuberculous mycobacteria also common

**Table 16. Etiology and Pathophysiology of Bronchiectasis**

Obstruction	Post-infection (results in dilatation of bronchial walls)	Impaired defenses (leads to interference of drainage, chronic infections and inflammation)
Tumour	Pneumonia	Hypogammaglobulinemia
Foreign body	TB	CF
Thick mucus	Measles	Defective leukocyte function
	Pertussis	Ciliary dysfunction (Kartagener's syndrome: bronchiectasis, sinusitis, situs inversus)
	Allergic bronchopulmonary aspergillosis	
	MAC ( <i>Mycobacteria avium</i> complex)	

### Signs and Symptoms

- chronic cough, purulent sputum (but 10-20% have dry cough), hemoptysis (can be massive), recurrent pneumonia, local crackles (inspiratory and expiratory), wheezes
- clubbing
- may be difficult to differentiate from chronic bronchitis

### Investigations

- PFTs: often demonstrate obstructive pattern but may be normal
- CXR
  - nonspecific: increased markings, linear atelectasis, loss of volume in affected areas
  - specific: "tram tracking" – parallel narrow lines radiating from hilum, cystic spaces, honeycomb like structures
- high-resolution thoracic CT (diagnostic, gold standard):
  - 87-97% sensitivity, 93-100% specificity
  - "signet ring": dilated bronchi with thickened walls where diameter bronchus > diameter of accompanying artery
- sputum cultures (routine + AFB)
- serum Ig levels
- sweat chloride if cystic fibrosis suspected (upper zone predominant)

### Treatment

- vaccination: influenza and Pneumovax®
- antibiotics (oral, IV, inhaled): routinely used for mild exacerbations, driven by sputum sensitivity; macrolides may be used chronically for an anti-inflammatory effect
- inhaled corticosteroids: decrease inflammation and improve FEV<sub>1</sub>
- oral corticosteroids for acute, major exacerbations
- chest physiotherapy, breathing exercises, physical exercise
- pulmonary resection: in selected cases with focal bronchiectasis

## Cystic Fibrosis (CF)

- see also [Pediatrics](#), P95

### Pathophysiology

- chloride transport dysfunction: thick secretions from exocrine glands (lung, pancreas, skin, reproductive organs) and blockage of secretory ducts

### Clinical Features

- results in severe lung disease, pancreatic insufficiency, diabetes and azoospermia
- other manifestations: meconium ileus in infancy, distal ileal obstruction in adults, sinusitis, liver disease
- chronic lung infections
  - S. aureus*: early
  - P. aeruginosa*: most common
  - B. cepacia*: worse prognosis but less common
  - Aspergillus fumigatus*

### Investigations

- sweat chloride test
  - increased concentrations of NaCl and K<sup>+</sup> ([Cl<sup>-</sup>] >60 mmol/L is diagnostic in children)
  - heterozygotes have normal sweat tests (and no symptoms)
- PFTs
  - early: airflow limitation in small airways
  - late: severe airflow hyperinflation, gas trapping, decreased DL<sub>CO</sub> (very late)

Usually presents in childhood as recurrent lung infections that become persistent and chronic.

- ABGs
  - hypoxemia, hypercapnia later in disease with eventual respiratory failure and cor pulmonale
- CXR
  - hyperinflation, increased pulmonary markings (especially upper lobes)

### Treatment

- chest physiotherapy and postural drainage
- bronchodilators (salbutamol ± ipratropium bromide)
- inhaled mucolytic (reduces mucus viscosity), hypertonic saline DNase
- inhaled tobramycin
- antibiotics (e.g. ciprofloxacin)
- lung transplant
- pancreatic enzyme replacements

### Prognosis

- depends on: infections (cepacia colonization), FEV<sub>1</sub>, acute pulmonary exacerbations, lung transplant vs. non-lung transplant

## Interstitial Lung Disease (ILD)

### Pathophysiology

- inflammatory and/or fibrosing process in the alveolar walls → distortion and destruction of normal alveoli and microvasculature
- typically associated with:
  - lung restriction (decrease in TLC and VC)
  - decreased lung compliance (increased or normal FEV<sub>1</sub>/FVC)
  - impaired diffusion (decreased DL<sub>CO</sub>)
  - hypoxemia due to V/Q mismatch (usually without hypercapnia until end stage)
  - pulmonary HTN and cor pulmonale occur with advanced disease secondary to hypoxemia and blood vessel destruction

### Etiology

- >100 known disorders can cause ILD
- majority due to unknown agents or cause

Table 17. Interstitial Lung Diseases

UNKNOWN ETIOLOGY		
Idiopathic interstitial pneumonias	Sarcoidosis	
UIP (usual interstitial pneumonia aka IPF)	Langerhans-cell histiocytosis (eosinophilic granuloma)	
NSIP (non-specific interstitial pneumonia)	Lymphangioleiomyomatosis	
LIP (lymphocytic interstitial pneumonia)	Pulmonary infiltrates with eosinophilia (PIE syndromes)	
COP (cryptogenic organizing pneumonia aka BOOP)		
KNOWN ETIOLOGY		
<b>ILD Associated With Systemic Rheumatic Disorders</b>	<b>ILD Associated With Drugs or Treatments</b>	<b>Inherited Disorders</b>
Scleroderma	Antibiotics (nitrofurantoin)	Familial IPF
Rheumatoid arthritis	Anti-inflammatory agents (methotrexate)	Telomerase mutations
SLE	Cardiovascular drugs (amiodarone)	Neurofibromatosis
Polymyositis/dermatomyositis	Antineoplastic agents (chemotherapy agents)	Tuberous sclerosis
Mixed connective tissue disease	Illicit drugs	Gaucher's disease
<b>Environment/Occupation Associated ILD</b>	Radiation	<b>Alveolar Filling Disorders</b>
Hypersensitivity pneumonitis (usually organic antigen)	<b>ILD Associated With Pulmonary Vasculitis</b>	Chronic eosinophilic pneumonia
Farmer's lung	Granulomatosis with Polyangiitis (GPA)	Pulmonary alveolar proteinosis
Air conditioner/humidifier lung	Goodpasture's syndrome	
Bird breeder's lung	Idiopathic pulmonary hemosiderosis	
Pneumoconioses (inorganic dust)		
Silicosis		
Asbestosis		
Coal workers' pneumoconiosis		
Chronic Beryllium Disease		
Pneumonitis from Gases/fumes/vapour		

In ILD think  
**FASSTEN** and **BAD RASH**

#### Upper Lung Disease (FASTEN)

**Farmer's lung** (hypersensitivity pneumonitis)  
**Ankylosing spondylitis**  
**Sarcoidosis**  
**Silicosis**  
**TB**  
**Eosinophilic granuloma** (Langerhans cell histiocytosis)  
**Neurofibromatosis**

#### Lower Lung Disease (BAD RASH)

**Bronchiolitis obliterans** with organizing pneumonia (BOOP)  
**Asbestosis**  
**Drugs** (nitrofurantoin, hydralazine, INH, amiodarone, many chemo drugs)  
**Rheumatologic disease**  
**Aspiration**  
**Scleroderma**  
**Hamman Rich** (acute interstitial pneumonia) and IPF

## Signs and Symptoms

- SOB, especially on exertion
- nonproductive cough
- crackles (dry, fine, end-inspiratory)
- clubbing (especially in IPF and asbestosis)
- features of cor pulmonale
- note that signs and symptoms vary with underlying disease process
  - e.g. sarcoidosis is seldom associated with crackles and clubbing

## Investigations

- CXR/high resolution CT (see also [Medical Imaging](#), MI7)
  - usually decreased lung volumes
  - reticular, nodular, or reticulonodular pattern (nodular <3 mm)
  - hilar/mediastinal adenopathy (especially in sarcoidosis)
- PFTs
  - restrictive pattern: decreased lung volumes and compliance
  - normal or increased FEV<sub>1</sub>/FVC (>70-80%), i.e. flow rates are often normal or high when corrected for absolute lung volume
  - DL<sub>CO</sub> decreased due to V/Q mismatch less surface area for gas exchange ± pulmonary vascular disease
- ABGs
  - with progression of disease, hypoxemia and respiratory alkalosis may be present
- other
  - bronchoscopy, bronchoalveolar lavage, lung biopsy
  - ESR, ANA (lupus), RF (RA), serum-precipitating antibodies to inhaled organic antigens (hypersensitivity pneumonitis), c-ANCA (GPA), anti-GBM (Goodpasture's)

The CXR can be normal in up to 15% of patients with interstitial lung disease.

## Unknown Etiologic Agents

### USUAL INTERSTITIAL PNEUMONIA (UIP) aka IDIOPATHIC PULMONARY FIBROSIS (IPF) (aka CRYPTOGENIC FIBROSING ALVEOLITIS)

#### Definition

- a progressive, irreversible condition characterized by fibrosis of lung parenchyma with no known cause
  - chest CT usually shows honeycomb lung, lung biopsy shows UIP (usual interstitial pneumonia) pattern
    - ♦ commonly presents over age 50, incidence rises with age; males > females
- DDx:
  - other idiopathic interstitial pneumonia, especially NSIP, but also COP and:
    - ♦ desquamative interstitial pneumonitis (DIP)
    - ♦ lymphocytic interstitial pneumonitis (LIP): usually 2° to immune conditions such as HIV (mostly in children), Sjögren's (now considered to be a hematological malignancy in most adult cases on a spectrum with lymphoma)

#### Signs and Symptoms

- commonly presents over age 50, incidence rises with age; males > females
- dyspnea on exertion, nonproductive cough, constitutional symptoms, late inspiratory fine crackles at lung bases, clubbing

#### Investigations

- labs (nonspecific, autoimmune serology usually negative)
- CXR: reticular or reticulonodular pattern with lower lung predominance; may appreciate honeycombing in advanced disease
- high resolution CT: lower zone peripheral reticular markings, traction bronchiectasis, honeycombing, ground glass not prominent in IPF
- biopsy: rarely for UIP as honeycombing makes radiologic diagnosis possible

#### Treatment

- O<sub>2</sub>
- generally does not respond to immunosuppression
- N-acetylcysteine (anti-oxidant)
- lung transplantation for advanced disease
- mean survival of 3 to 5 yr after diagnosis

## SARCOIDOSIS

#### Definition

- idiopathic non-infectious granulomatous multi-system disease with lung involvement in 90%
- characterized pathologically by non-caseating granulomas
- numerous HLA antigens have been shown to play a role and familial sarcoidosis is now recognized

#### IPF Prevalence

- Age 35-44: 2-7 per 100 000
- Age >75: 175 per 100 000

#### Prednisone, Azathioprine, and N-Acetylcysteine for Pulmonary Fibrosis

NEJM 2012;366:1968-1977

**Study:** Double blind, placebo-controlled, multicenter, RCT, 60-wk treatment period.

**Population:** 236 patients between 35 and 85 yr of age with IPF and mild-moderate lung function impairment (FVC >50%).

**Intervention:** Patients were randomized to receiving a combination of prednisone, azathioprine and NAC (combination therapy); NAC alone; or placebo.

**Outcome:** Change in longitudinal measurements of FVC over the treatment period.

**Results:** The combination therapy group was terminated early (mean follow-up of 32 wk) as patients in this group had an increased rate of death (8 vs. 1, P=0.01) and hospitalization (23 vs. 7, P<0.001) compared to placebo. Additionally, there was no evidence of physiological or clinical benefit for the combination therapy group.

**Conclusions:** Patients with IPF treated with combination therapy (NAC, azathioprine and prednisone) were at higher risk of death and hospitalization than the placebo group.

## Epidemiology

- typically affects young and middle-aged patients
- higher incidence among black Americans and people at northern latitudes e.g. Scandinavia, Canada

## Signs and Symptoms

- asymptomatic, cough, dyspnea, fever, arthralgia, malaise, erythema nodosum, chest pain
- chest exam often normal
- common extrapulmonary manifestations
  - cardiac (arrhythmias, sudden death)
  - eye involvement (anterior or posterior uveitis)
  - skin involvement (skin papules, erythema nodosum, lupus pernio)
  - peripheral lymphadenopathy
  - arthralgia
  - hepatomegaly ± splenomegaly
- less common extra-pulmonary manifestations involve bone, CNS and kidney
- two acute sarcoid syndromes
  - Löfgren's syndrome: fever, erythema nodosum, bilateral hilar lymphadenopathy, arthralgias
  - Heerfordt-Waldenström syndrome: fever, parotid enlargement, anterior uveitis, facial nerve palsy

Sarcoid is usually silent on auscultation.

## Investigations

- CBC (cytopenias from spleen or marrow involvement)
- serum electrolytes, creatinine, liver enzymes, calcium (hypercalcemia/hypercalciuria due to vitamin D activation by granulomas)
- hypergammaglobulinemia, occasionally RF positive
- elevated serum ACE (non-specific and non-sensitive)
- CXR: predominantly nodular opacities especially in upper lung zones ± hilar adenopathy
- PFTs: normal, obstructive pattern, restrictive pattern with normal flow rates and decreased DL<sub>CO</sub>
- ECG: to rule out conduction abnormalities
- slit-lamp eye exam: to rule out uveitis

Most common presentation: asymptomatic CXR finding

Hilar adenopathy refers to enlargement of mediastinal lymph nodes which is most often seen by standard CXR as spherical/ellipsoidal and/or calcified nodes.  
If unilateral think neoplasia, TB, or sarcoid.  
If bilateral think sarcoid or lymphoma.

## Diagnosis

- biopsy
  - transbronchial lung biopsy, transbronchial lymph node aspiration, endobronchial ultrasound guided surgical (EBUS) biopsy or mediastinoscopic lymph node biopsy for granulomas
  - in ~75% of cases, transbronchial biopsy shows granulomas in the parenchyma even if the CXR is normal

## Staging

- radiographic, based on CXR
  - Stage 0: normal radiograph
  - Stage I: bilateral hilar lymphadenopathy ± right paratracheal lymphadenopathy
  - Stage II: bilateral hilar lymphadenopathy and diffuse interstitial disease
  - Stage III: interstitial disease only (reticulonodular pattern or nodular pattern)
  - Stage IV: pulmonary fibrosis (honeycombing)

## Treatment

- 85% of stage I resolve spontaneously
- 50% of stage II resolve spontaneously
- steroids for symptoms, declining lung function, hypercalcemia, or involvement of eye, CNS, kidney, or heart (not for abnormal CXR alone)
- methotrexate or other immunosuppressives occasionally used

## Prognosis

- approximately 10% mortality secondary to progressive fibrosis of lung parenchyma

### Corticosteroids for Pulmonary Sarcoidosis

Cochrane DB Syst Rev 2005;CD001114

**Study:** Meta-analysis of 13 RCTs involving 1066 participants examining the use of steroids (oral or inhaled) in sarcoidosis.

**Results:** Oral steroids demonstrated an improvement in CXR (RR 1.46, 1.01 to 2.09). For inhaled corticosteroids, two studies showed no improvement in lung function and one study showed an improvement in diffusing capacity. No data on side-effects.

**Conclusions:** Oral steroids improve CXR findings and global scores of CXR, symptoms and spirometry over 3-24 mo, but do not improve lung function or modify disease course. Oral steroids may be of benefit for patients with Stage 2 and 3 disease.

## Known Etiologic Agents

### HYPERSENSITIVITY PNEUMONITIS

- also known as extrinsic allergic alveolitis
- non-IgE mediated inflammation of lung parenchyma (acute, subacute, and chronic forms)
- caused by sensitization to inhaled agents, usually organic dust
- pathology: airway-centered, poorly formed granulomas and lymphocytic inflammation
- exposure usually related to occupation or hobby
  - Farmer's Lung (*Thermophilic actinomycetes*)
  - Bird Breeder's/Bird Fancier's Lung (*Chlamydia psittaci* in bird droppings)
  - Humidifier Lung (*Aureobasidium pullulans*)
  - Sauna Taker's Lung (*Aureobasidium spp.*)

## Signs and Symptoms

- acute presentation: (4-6 h after exposure)
  - dyspnea, cough, fever, chills, malaise (lasting 18-24 h)
  - CXR: diffuse infiltrates
  - type III (immune complex) reaction
- subacute presentation: more insidious onset than acute presentation
- chronic presentation
  - insidious onset
  - dyspnea, cough, malaise, anorexia, weight loss
  - PFTs: progressively restrictive
  - CXR: predominantly upper lobe reticulonodular pattern
  - type IV (cell mediated, delayed hypersensitivity) reaction (see [Rheumatology](#), RH2)
- in both acute and chronic reactions, serum precipitins may be detectable (neither sensitive nor specific)

## Treatment

- early diagnosis: avoidance of further exposure is critical as chronic changes are irreversible
- systemic corticosteroids can relieve symptoms and speed resolution

## PNEUMOCONIOSES

- reaction to inhaled inorganic dusts 0.5-5  $\mu\text{m}$  in size
- no effective treatment, therefore key is exposure prevention through the use of protective equipment
- smoking cessation, annual influenza and pneumococcal vaccination, rehabilitation, lung transplant for endstage disease

**Table 18. Pneumoconioses**

Asbestosis	Silicosis	Coal Worker's Pneumoconiosis (CWP)
<ul style="list-style-type: none"> <li>• Exposure risks: insulation, shipyard, construction, brake linings, pipe fitters, plumbers</li> <li>• Slowly progressive diffuse interstitial fibrosis induced by inhaled asbestos fibres</li> <li>• Etiology: usually &gt; 10-20 yr of exposure; may develop with shorter but heavier exposure; typically prolonged interval (20-30 yr) between exposure and clinical disease</li> <li>• Signs and symptoms               <ul style="list-style-type: none"> <li>▪ Insidious onset</li> <li>▪ SOB</li> <li>▪ Cough: paroxysmal, non-productive</li> <li>▪ Fine end-respiratory crackles (increased at bases)</li> <li>▪ Clubbing (much more likely in asbestosis than silicosis or coal workers' pneumoconioses)</li> </ul> </li> <li>• Investigations: CXR               <ul style="list-style-type: none"> <li>▪ Lower &gt; upper lobe</li> <li>▪ Reticulonodular pattern, may develop IPF-like honeycombing</li> <li>▪ Asbestos exposure can also cause pleural and diaphragmatic plaques (<math>\pm</math> calcification), pleural effusion, round atelectasis</li> <li>▪ Microscopic examination reveals ferruginous bodies: yellow-brown rod-shaped structures which represent asbestos fibres coated in macrophages</li> </ul> </li> <li>• Complications: asbestos exposure increases risk of bronchogenic CA and malignant mesothelioma               <ul style="list-style-type: none"> <li>▪ Risk of lung cancer dramatically increased for smokers</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• At risk population: sandblasters, rock miners, stone cutters, quarry and highway workers</li> <li>• Etiology: generally requires &gt; 20 yr exposure; may develop with much shorter but heavier exposure</li> <li>• Signs and symptoms: dyspnea, cough and wheezing</li> <li>• Investigations: CXR               <ul style="list-style-type: none"> <li>▪ Upper &gt; lower lobe</li> <li>▪ Early: nodular disease (simple pneumoconiosis), lung function usually normal</li> <li>▪ Late: nodules coalesce into masses (progressive massive fibrosis)</li> </ul> </li> <li>• Possible hilar lymph node enlargement (frequently calcified), especially "egg shell" calcification</li> <li>• Complications: mycobacterial infection (e.g. TB)</li> </ul>	<ul style="list-style-type: none"> <li>• At risk population: coal workers, graphite workers</li> <li>• Etiology: coal and silica, coal is less fibrogenic than silica</li> <li>• Pathologic hallmark is coal macule</li> <li>• Simple CWP               <ul style="list-style-type: none"> <li>▪ No signs or symptoms, usually normal lung function</li> <li>▪ CXR: multiple nodular opacities, mostly upper lobe</li> </ul> </li> <li>• Complicated CWP (also known as progressive massive fibrosis)               <ul style="list-style-type: none"> <li>▪ Dyspnea</li> <li>▪ CXR: opacities larger and coalesce</li> </ul> </li> <li>• Course: few patients progress to complicated CWP</li> <li>• Caplan's syndrome: rheumatoid arthritis and CWP present as larger nodules</li> </ul>

Diaphragmatic plaques are highly suggestive of asbestosis, especially if bilateral.

### CXR Fibrotic Patterns

- Asbestosis: lower > upper lobes
- Silicosis: upper > lower lobes
- Coal: upper > lower lobes

Remember to involve occupational health at place of work for data collection and treatment plan. Also counsel re: worker's insurance as per jurisdiction (e.g. Workers Safety Insurance Board (WSIB) in Ontario).

## ILD ASSOCIATED WITH DRUGS OR TREATMENTS

### Drug-Induced

- antineoplastic agents: bleomycin, mitomycin, busulfan, cyclophosphamide, methotrexate, chlorambucil, BCNU (carmustine)
- antibiotics: nitrofurantoin, penicillin, sulfonamide
- cardiovascular drugs: amiodarone, tocainide
- anti-inflammatory agents: methotrexate, penicillamine
- gold salts
- illicit drugs (heroin, methadone)
- rituximab, anti-TNF  $\alpha$  agents (infliximab, etanercept, adalimumab)

### Radiation-Induced

- early pneumonitis: approximately 6 wk post-exposure
- late fibrosis: 6-12 mo post-exposure
- infiltrates conform to the shape of the radiation field

# Pulmonary Vascular Disease

## Pulmonary Hypertension

### Definition

- mean pulmonary arterial pressure >25 mmHg at rest and >30 mmHg with exercise, or a systolic pulmonary artery pressure of >40 mmHg at rest
- in the past, pulmonary HTN was classified as primary or secondary pulmonary HTN, but this classification was modified to a more clinically useful, treatment based classification (Table 19)

**Table 19. World Health Organization Classification of Pulmonary Hypertension**

Classification	Some Causes	Treatment Options	Consider in All Patient's with PH
<b>I. Pulmonary arterial HTN</b>	Idiopathic Collagen vascular disease (scleroderma, SLE, RA) Congenital systemic-to-pulmonary shunts (Eisenmenger syndrome) Portopulmonary HTN HIV infection Drugs and toxins (e.g. anorexigens) Pulmonary veno-occlusive disease Schistosomiasis Pulmonary capillary hemangiomatosis Sickle cell disease	No effective treatment CCB's or advanced therapy often needed The latter includes: prostanoids, endothelin receptor antagonists, PDE5 inhibitors Lung transplantation	Oxygen therapy Exercise Consider anticoagulation
<b>II. Pulmonary HTN due to the left heart disease</b>	Left-sided atrial or ventricular heart disease (e.g. LV dysfunction) Left-sided valvular heart disease (e.g. aortic stenosis, mitral stenosis)	Treat underlying heart disease	
<b>III. Pulmonary HTN due to lung disease and/or hypoxia</b>	Parenchymal lung disease (COPD, interstitial fibrosis, cystic fibrosis) Chronic alveolar hypoxia (chronic high altitude, alveolar hypoventilation disorders, sleep disordered breathing)	Treat underlying cause of hypoxia and correct with supplemental oxygen (proven mortality benefit)	
<b>IV. Chronic thromboembolic pulmonary HTN (CTEPH)</b>	Thromboembolic obstruction of proximal pulmonary arteries Obstruction of distal pulmonary arteries – PE (thrombus, foreign material, tumour, in situ thrombosis)	Anticoagulation, thromboendarterectomy	
<b>V. Pulmonary HTN with unclear multifactorial mechanisms</b>	Hematologic disorders Systemic disorders (e.g. sarcoidosis) Metabolic disorders Extrinsic compression of central pulmonary veins (tumour, adenopathy, fibrosing mediastinitis)	Treat underlying cause	

Adapted from Simonneau, et al. J Am Coll of Cardiol 2009

### Mechanisms of Pulmonary Hypertension (simplified)

- hypoxic vasoconstriction
  - chronic hypoxia causes pulmonary vasoconstriction by a variety of actions on the pulmonary artery endothelium and smooth muscle cells, such as: down regulation of endothelial nitric oxide synthase and alteration of voltage gated potassium channels leading to vasoconstriction
  - causes: COPD, chronic alveolar hypoxia
- decreased area of pulmonary vascular bed
  - leads to a rise in resting pulmonary arterial pressure
  - causes: collagen vascular disease, HIV infection, drugs and toxins, thrombotic or embolic disease, inflammatory, pulmonary capillary hemangiomatosis, interstitial fibrosis, CF
- volume and pressure overload
  - significant HTN only occurs with excessive volume overload, since pulmonary artery pressure will not rise in otherwise normal lung until pulmonary blood flow exceeds 2.5x the basal rate
  - causes: congenital systemic to pulmonary shunts (e.g. VSD, ASD, PDA), portopulmonary HTN, left-sided heart conditions, pulmonary veno-occlusive disease, extrinsic compression of central pulmonary veins

## IDIOPATHIC PULMONARY ARTERIAL HYPERTENSION (aka PRIMARY PULMONARY HYPERTENSION)

### Definition

- pulmonary HTN in the absence of a demonstrable cause
- exclude:
  - left-sided cardiac valvular disease
  - myocardial disease
  - congenital heart disease
  - any clinically significant parenchymal lung disease
  - systemic connective-tissue disease
  - chronic thromboembolic disease

### Epidemiology

- usually presents in young women (20-40 yr); mean age of diagnosis is 36 yr
- most cases are sporadic; familial predisposition in 10% of cases, some linked to mutations in BMPR2
- may be associated with the use of anorexic drugs (e.g. Aminorex®, Fenfluramine®), also amphetamines and cocaine

### Signs and Symptoms

- exertional dyspnea, fatigue, syncope, exertional chest pain, Raynaud's phenomenon
- see Table 20

**Table 20. Signs and Symptoms of Pulmonary Hypertension**

Symptoms	Signs
Dyspnea	Loud, palpable P <sub>2</sub>
Fatigue	RV heave
Substernal chest pain	Right-sided S <sub>4</sub> (due to RVH)
Syncope	Systolic murmur [tricuspid regurgitation (TR)]
Symptoms of underlying disease	If RV failure: right sided S <sub>3</sub> , increased JVP, positive HJR, peripheral edema, TR

### Investigations

- CXR: enlarged central pulmonary arteries, cardiac changes due to RV enlargement (filling of retrosternal air space)
- ECG
  - RVH/right-sided strain (see [Cardiology and Cardiovascular Surgery](#), C7)
- 2-D echo doppler assessment of right ventricular systolic pressure
- cardiac catheterization: direct measurement of pulmonary artery pressures (necessary to confirm diagnosis)
- PFTs to assess for underlying lung disease: DL<sub>CO</sub> usually reduced
- CT angiogram to assess lung parenchyma and possible PE
- V/Q scan ± pulmonary angiogram to rule out thromboembolic disease
- serology: ANA positive in 30% of patients with primary pulmonary HTN. Other serologic markers can be used in the appropriate clinical setting

### Treatment

- see Table 19

### Prognosis

- 2-3 yr mean survival from time of diagnosis
- survival decreases to approximately 1 yr if severe pulmonary HTN or right-heart failure

Pulmonary arterial pressures are measured by pulmonary artery catheters (aka Swan-Ganz catheter) which are inserted into a large vein (often internal jugular). A balloon at the end of the catheter tip is inflated causing the catheter to advance through the right side of the heart and into the pulmonary artery. This allows for the measurement of RA, RV, PA and pulmonary capillary wedge pressures as well as sampling of mixed venous blood. A thermistor near the end of the catheter also allows for assessment of cardiac output by thermodilution.

### Guidelines for Vasodilator Response in Pulmonary Arterial HTN

- Patients with IPAH that respond to vasodilators acutely, have an improved survival with long-term use of CCBs
- Vasoreactivity testing: short-acting agent such as IV epoprostenol, IV adenosine or inhaled NO
- Positive vasodilator response: mean PAP fall of at least 10 mmHg to ≤40 mmHg with an increased or unchanged cardiac output (European Society of Cardiology)
- Positive vasodilator response: should be considered as candidate for trial of oral CCB therapy

Medical Therapy for Pulmonary Arterial Hypertension. ACCP Evidence-Based Clinical Practice Guidelines. *Chest* 2004;(Suppl)06:126

## Pulmonary Embolism (PE)

### Definition

- lodging of a blood clot in the pulmonary arterial tree with subsequent increase in pulmonary vascular resistance, impaired V/Q matching, and possibly reduced pulmonary blood flow

### Etiology and Pathophysiology

- one of the most common causes of preventable death in the hospital
- proximal leg thrombi (popliteal, femoral or iliac veins) are the source of most clinically recognized pulmonary emboli
- thrombi often start in calf, but must propagate into proximal veins to create a sufficiently large thrombus for a clinically significant PE
- fewer than 30% of patients have clinical evidence of DVT (e.g. leg swelling, pain or tenderness)
- always suspect PE if patient develops fever, sudden dyspnea, chest pain, or collapse 1-2 wk after surgery

### Virchow's Triad

- Venous stasis
- Endothelial cell damage
- Hypercoagulable states

## Risk Factors

- stasis
  - immobilization: paralysis, stroke, bed rest, prolonged sitting during travel, immobilization of an extremity after fracture
  - obesity, CHF
  - chronic venous insufficiency
- endothelial cell damage
  - post-operative injury, trauma
- hypercoagulable states
  - underlying malignancy (particularly adenocarcinoma)
  - cancer treatment (chemotherapy, hormonal)
  - exogenous estrogen administration (OCP, HRT)
  - pregnancy, post-partum
  - prior history of DVT/PE, family history
  - nephrotic syndrome
  - coagulopathies: Factor V Leiden, Prothrombin 20210A variant, inherited deficiencies of antithrombin/protein C/protein S, antiphospholipid antibody, hyperhomocysteinemia, increased Factor VIII levels, and myeloproliferative disease
- increasing age

## Investigations (if highly suspicious, go straight to spiral CT angiogram)

- see [Emergency Medicine](#), Figure 12, ER34
- **Pulmonary Angiogram (Gold Standard)**
  - filling defect indicative of embolus; negative angiogram excludes clinically relevant PE
  - more invasive, and harder to perform than CT, therefore done infrequently
- D-dimer (products of thrombotic/fibrinolytic process)
  - highly sensitive D-dimer result can exclude DVT/PE if pretest probability is already low
  - little value if pretest probability is high
  - if D-dimer positive, will need further evaluation with compression U/S
- CT angiogram is both sensitive and specific for PE
  - diagnosis and management uncertain for small filling defects
  - spiral CT may identify an alternative diagnosis if PE is not present
  - CT scanning of the proximal leg and pelvic veins can be done at the same time and may be helpful
- venous duplex U/S or Doppler
  - with leg symptoms
    - ♦ positive test rules in proximal DVT
    - ♦ negative test rules out proximal DVT
  - without leg symptoms
    - ♦ positive test rules in proximal DVT
    - ♦ negative test does not rule out a DVT: patient may have non-occlusive or calf DVT
- ECG
  - findings not sensitive or specific
  - sinus tachycardia most common; may see non-specific ST segment and T wave changes
  - RV strain, RAD, RBBB, S1-Q3-T3 with massive embolization
- CXR
  - frequently normal; no specific features
  - atelectasis (subsegmental), elevation of a hemidiaphragm
  - pleural effusion: usually small
  - Hampton's hump: cone-shaped area of peripheral opacification representing infarction
  - Westermark's sign: dilated proximal pulmonary artery with distal oligemia/decreased vascular markings (difficult to assess without prior films)
  - dilatation of proximal PA: rare
- V/Q scan (very sensitive but low specificity)
  - order scan if
    - ♦ CXR normal, no COPD
    - ♦ contraindication to CT (contrast allergy, renal dysfunction, pregnancy)
  - avoid V/Q scan if
    - ♦ CXR abnormal or COPD
    - ♦ inpatient
    - ♦ suspect massive PE
  - results
    - ♦ normal: excludes the diagnosis of PE
    - ♦ high probability: most likely means PE present, unless pre-test probability is low
    - ♦ 60% of V/Q scans are nondiagnostic
- echocardiogram
  - useful to assess massive or chronic PE
  - not routinely done
- ABG
  - no diagnostic use in PE (insensitive and nonspecific)
  - may show respiratory alkalosis (due to hyperventilation)

### Clinical Prediction Rule for Pulmonary Embolism

*J Thromb Hemost* 2000;83:416-420

Wells Criteria

Risk Factors	Points
Clinical signs of DVT	3.0
No more likely alternative diagnosis (using H&P, CXR, ECG)	3.0
Immobilization or surgery in the previous 4 wk	1.5
Previous PE/DVT	1.5
HR >100 beats/min	1.5
Hemoptysis	1.0
Malignancy	1.0

### Clinical probability

Low (0-2)	3%
Intermediate (3-6)	28%
High (>6)	78%

Modified Wells: >4 PE likely; ≤4 PE unlikely

*JAMA* 2006

### PE Rule-out Criteria (PERC)

#### Prospective Multicenter Evaluation of the Pulmonary Embolism Rule-out Criteria

*J Thromb Hemost* 2008;6:772

- Age less than 50 yr
- Heart rate less than 100 bpm
- Oxyhemoglobin saturation ≥95 percent
- No hemoptysis
- No estrogen use
- No prior DVT or PE
- No unilateral leg swelling
- No surgery or trauma requiring hospitalization within the past 4 wk

Acute PE can probably be excluded without further diagnostic testing if the patient meets all PERC criteria AND there is a low clinical suspicion for PE, according to either the Wells criteria or a low gestalt probability determined by the clinician prior to diagnostic testing for PE.

### Evaluation of a Suspected Pulmonary Embolism

*Low clinical probability of embolism:*

**D-dimer (+ve) → CT scan (+ve) → ruled in**  
(-ve) ruled out (-ve) ruled out

*Intermediate or high probability:*

**CT scan (-ve) → ruled out**  
(+ve) ruled in

*Notes:*

- Use D-dimers only if low clinical probability, otherwise, go straight to spiral CT
- If using V/Q scans (CT contrast allergy or renal failure):
  - Negative V/Q scan rules out the diagnosis
  - High probability V/Q scan only rules in the diagnosis if have high clinical suspicion
  - Inconclusive V/Q scan requires leg U/S to look for DVT or spiral CT

Classic ECG finding of PE is S<sub>1</sub>-Q<sub>3</sub>-T<sub>3</sub> (inverted T<sub>3</sub>), but most commonly see only sinus tachycardia.

D-dimer is elevated in patients with recent surgery, cancer, inflammation, infection, and severe renal dysfunction. It has good sensitivity and negative predictive value, but poor specificity and positive predictive value.

## Treatment

- admit for observation (patients with DVT only are often sent home on LMWH)
- oxygen: supplemental O<sub>2</sub> if hypoxemic or short of breath
- pain relief: analgesics if chest pain – narcotics or acetaminophen
- acute anticoagulation: therapeutic-dose SC LMWH or IV heparin – start ASAP
  - anticoagulation stops clot propagation, prevents new clots and allows endogenous fibrinolytic system to dissolve existing thromboemboli over months
  - get baseline CBC, INR, aPTT ± renal function ± liver function
  - for SC LMWH: dalteparin 200 U/kg once daily or enoxaparin 1 mg/kg bid – no lab monitoring – avoid or reduce dose in renal dysfunction
  - for IV heparin: bolus of 75 U/kg (usually 5,000 U) followed by infusion starting at 20 U/kg/h – aim for aPTT 2-3x control
- long term anticoagulation
  - warfarin: start the same day as LMWH/heparin – overlap warfarin with LMWH/heparin for at least 5 d and until INR in target range of 2-3 for at least 2 d
  - LMWH instead of warfarin for pregnancy, active cancer, or high bleeding risk patients
  - dabigatran has been shown to have lower bleeding risk than warfarin
- IV thrombolytic therapy
  - if patient has massive PE (hypotension or clinical right heart failure) and no contraindications
  - hastens resolution of PE but may not improve survival or long-term outcome and doubles risk of major bleeding
- interventional thrombolytic therapy
  - massive PE is preferentially treated with catheter-directed thrombolysis by an interventional radiologist
  - works better than IV thrombolytic therapy and fewer contraindications
- IVC filter: only if recent proximal DVT + absolute contraindication to anticoagulation
- duration of long-term anticoagulation: individualized, however generally:
  - if reversible cause for PE (surgery, injury, pregnancy, etc.): 3-6 mo
  - if PE unprovoked: 6 mo to indefinite
  - if ongoing major risk factor (active cancer, antiphospholipid antibody, etc.): indefinite

## Thromboprophylaxis

- mandatory for most hospital patients: reduces DVT, PE, all-cause mortality, cost-effective
- start ASAP
- continue at least until discharge or recommend extending for 35 d postoperatively, if major orthopedic surgery

**Table 21. VTE Risk Categories and Prophylaxis** (see [Hematology](#), H32)

Risk Group	Prophylaxis Options
<b>Low thrombosis risk:</b> Medical patients: fully mobile Surgery: <30 min, fully mobile	No specific prophylaxis Frequent ambulation
<b>Moderate thrombosis risk:</b> Most general, gynecologic, urologic surgery Sick medical patients	LMWH Low dose unfractionated heparin Fondaparinux
<b>High thrombosis risk:</b> Arthroplasty, hip fracture surgery Major trauma, spinal cord injury	LMWH Fondaparinux Warfarin (INR 2-3) Dabigatran Apixaban Rivaroxaban Low dose unfractionated heparin
<b>High bleeding risk:</b> Neurosurgery, intracranial bleed Active bleeding	TED stockings, pneumatic compression devices LMWH or low dose heparin when bleeding risk decreases

### Workup for Idiopathic VTE

**Thrombophilia Workup:** recurrent or idiopathic DVT/PE; age <50, FHx, unusual location, massive.

**Malignancy Workup:** 12% of patients with idiopathic VTE will have a malignancy.

### Extended Use of Dabigatran, Warfarin or Placebo in Venous Thromboembolism

*NEJM* 2013;368:709-718

**Study:** Two double blind, RCTs; one comparing against placebo, the other against active treatment. **Population:** 4199 patients (2856 in active-control study, 1343 in placebo-control study) with VTE who had completed at least 3 mo of therapy.

**Intervention:** In the active-control study, patients randomized to either 150 mg dabigatran or warfarin (INR 2.0-3.0). Patients in the placebo-control study received either 150 mg dabigatran or placebo.

**Outcome:** Recurrence of VTE, risk of major or clinically relevant bleed.

**Results:** In the active-control study, there was a hazard ratio (HR) of 1.44 (95% CI 0.78-2.64 for non-inferiority) of recurrent VTE with dabigatran vs. warfarin. HR of major or clinically relevant bleed was 0.54 (95% CI 0.41-0.71). In the placebo-control study, the HR of VTE with dabigatran vs. placebo was 0.08 (95% CI 0.02-0.25). HR of major or clinically relevant bleed was 2.92 (95% CI 1.52-5.60).

**Conclusions:** Dabigatran appears to be non-inferior to warfarin in the prevention of VTE recurrence. Dabigatran is associated with a lower risk of major or clinically relevant bleed than warfarin, but greater than placebo.

### Excluding Pulmonary Embolism at Bedside without Diagnostic Imaging

*Ann Intern Med* 2001;135:98-107

**Study:** Multicentre, prospective cohort study.

**Patients:** 930 patients with suspected PE at emergency departments at 4 tertiary care hospitals in Canada.

**Intervention:** A Wells score was used to determine patient's pretest probability (PTP) of PE along with a D-dimer test was performed. Patients with low PTP and a negative D-dimer test had no further testing and the diagnosis of PE was excluded. All other patients had V/Q scanning, and if non-diagnostic, had bilateral deep venous ultrasonography. Further serial ultrasonography and angiography were done depending on the patients PTP and lung-scanning results.

**Main outcomes:** Diagnosis of PE and the development of thromboembolic events at 3 mo follow-up.

**Results:** One of 759 patients in whom PE was initially ruled out developed a thromboembolic event during follow-up (0.1% [CI 0.0%-0.7%]). One of the 437 patients with negative D-dimers and low clinical PTP developed PE during follow up (NPV 99.5%, CI 99.1-100%).

**Conclusion:** Managing patients with suspected pulmonary embolism on the basis of PTP and D-dimer results is safe and decreases the need for diagnostic imaging.

## Pulmonary Vasculitis

Table 22. Pulmonary Vasculitis

Disease	Definition	Pulmonary Features	Extra-pulmonary Features	Investigations	Treatment
<b>Granulomatosis with Polyangiitis (Wegener's Granulomatosis)</b> (see <a href="#">Nephrology</a> , NP24)	Systemic vasculitis of medium and small arteries	Necrotizing granulomatous lesions of the upper and lower respiratory tract	Focal necrotizing lesions of arteries and veins; Crescentic glomerulonephritis	CXR: nodules, cavities, and alveolar opacities c-ANCA Tissue confirmation	Corticosteroids and cyclophosphamide or rituximab
<b>Churg-Strauss Syndrome (Allergic Granulomatosis and Angiitis)</b>	Multisystem disorder characterized by allergic rhinitis, asthma, and prominent peripheral eosinophilia	Asthma Infiltrates	Life-threatening systemic vasculitis involving the lungs, pericardium and heart, kidneys, skin, and PNS (mononeuritis multiplex)	Peripheral eosinophilia is the most common finding p-ANCA may be positive Biopsy involved tissue	Corticosteroids
<b>Goodpasture's Disease</b> (see <a href="#">Nephrology</a> , NP24)	A disorder characterized by diffuse alveolar hemorrhage and glomerulonephritis caused by anti-GBM antibodies, which cross-react with basement membranes of the kidney and lung	Hemoptysis May follow an influenza infection	Anemia	CXR: may see alveolar infiltrates if hemorrhage is profuse ELISA test with anti-GBM antibodies Renal biopsy/indirect immunofluorescence shows linear staining	Acutely: corticosteroids, plasmapheresis Immunosuppressive therapy Severe cases: bilateral nephrectomy
 <b>Systemic Lupus Erythematosus, Rheumatoid Arthritis, Scleroderma</b>	See <a href="#">Rheumatology</a> , RH8				

## Pulmonary Edema

- see [Cardiology and Cardiovascular Surgery](#), C32

Scleroderma is the most common collagen vascular disease affecting the lung.

## Diseases of the Mediastinum and Pleura

### Mediastinal Masses

#### Definition

- mediastinum: bound by the thoracic inlet, diaphragm, sternum, vertebral bodies and the pleura
- can be broken down into 3 compartments: anterior, middle and posterior (see sidebar)

#### Etiology and Pathophysiology

- diagnosis is made by location and patient's age
- anterior compartment: more likely to be malignant
  - "Five Ts" (see sidebar), lymphoma, lipoma, pericardial cyst
- middle compartment
  - pericardial cyst, bronchogenic cyst/tumour, lymphoma, lymph node enlargement, aortic aneurysm
- posterior compartment
  - neurogenic tumours, meningocele, enteric cysts, lymphoma, diaphragmatic hernias, esophageal tumour, aortic aneurysm

#### Signs and Symptoms

- 50% asymptomatic (mainly benign); when symptomatic, 50% are malignant
- chest pain, cough, dyspnea, recurrent respiratory infections
- hoarseness, dysphagia, Horner's syndrome, facial/upper extremity edema (SVC compression)
- paraneoplastic syndromes [e.g. myasthenia gravis (thymomas)]

#### Investigations

- CXR (compare to previous)
- CT with contrast (anatomic location, density, relation to mediastinal vascular structures)
- MRI: specifically indicated in the evaluation of neurogenic tumours
- U/S (best for assessment of structures in close proximity to the heart and pericardium)
- radionuclide scanning:  $^{131}\text{I}$  (for thyroid), gallium (for lymphoma)
- biochemical studies: thyroid function, serum calcium, phosphate, PTH, AFP,  $\beta$ -hCG
- biopsy (mediastinoscopy, percutaneous needle aspiration)

#### Anterior Compartment

##### 5 Ts

Thymoma  
Thyroid enlargement (goiter)  
Teratoma  
Thoracic aortic aneurysm  
Tumours  
(lymphoma, parathyroid, esophageal, angiomatous)

#### Mediastinal Components

**Anterior:** sternum to posterior aspect of heart and great vessels. Includes: thymus, extrapericardial aorta and branches, great veins, lymphatic tissues.  
**Middle:** pericardium (anteriorly) posterior pericardial reflection, diaphragm, thoracic inlet. Includes: heart, intrapericardial great vessels, pericardium, trachea.  
**Posterior:** posterior pericardial reflection, posterior border of vertebral bodies, first rib to the diaphragm. Includes: esophagus, vagus nerve, thoracic duct, sympathetic chain, azygous venous system.

#### Horner's Syndrome

Ptosis, Miosis, Anhidrosis

## Management

- excision if symptomatic enlarging benign masses or concerns of malignancy
- resect bronchogenic cysts and localized neurogenic tumours via minimally invasive video assisted procedures
- exploration via sternotomy or thoracotomy
- diagnostic biopsy rather than major operation if mass is likely to be a lymphoma, germ cell tumour, or unresectable invasive malignancy
- $\pm$  post-op radiotherapy/chemotherapy if malignant

## Mediastinitis

- commonest causes: postoperative complications of cardiovascular or thoracic surgical procedures

### Acute

- etiology
  - complication of endoscopy (e.g. esophageal perforation providing entry point for infection)
  - esophageal or cardiac surgery
  - tumour necrosis
- signs and symptoms
  - fever, substernal pain
  - pneumomediastinum, mediastinal compression
  - Hamman's sign (auscultatory "crunch" during cardiac systole)
- treatment
  - antibiotics, drainage,  $\pm$  surgical closure of perforation

### Chronic

- usually granulomatous process or fibrosis related to previous infection (e.g. histoplasmosis, TB, sarcoidosis, syphilis)

#### Multidetector Computed Tomography for Acute Pulmonary Embolism (PIOPED II Trial)

NEJM 2006;354:2317-2327

**Study:** Multicentre, prospective study investigating accuracy of computed tomography angiography (CTA) alone and combined with venous phase imaging (CTA-CTV) for the diagnosis of PE.

**Patients:** 824 patients of several thousand eligible for study received reference diagnosis to confirm absence or presence of PE (V/Q scan, venous compression U/S of lower extremities, and pulmonary digital-subtraction angiography (DSA) if necessary). To confirm absence, patients in whom PE was excluded were telephoned 3-6 mo after enrollment. Any deaths were reviewed by an outcome committee. All patients enrolled also underwent clinical assessment of PE (including a Wells score) prior to imaging.

**Outcomes:** Diagnosis of pulmonary embolism.

**Results:** 773 of 824 patients had adequate CTAs for interpretation. PE was diagnosed in 192 of the 824 patients. Sensitivity was 83% (150 of 181 patients, 95% CI, 0.76-0.92) and specificity was 96% (567 of 592 patients, 95% CI, 0.93-0.97). However, the predictive value of CTA-CTV varied when clinical pre-test probability was taken into account. PPV of CTA for high, intermediate and low clinical probability were 96% (95% CI, 0.78-0.99), 92% (95% CI, 0.84-0.96), and 58% (95% CI, 0.40-0.73) respectively. NPV of CTA for high, intermediate and low clinical probability were 60% (95% CI, 0.32-0.83), 89% (95% CI, 0.82-0.93), and 96% (95% CI, 0.92-0.98) respectively.

**Conclusion:** CTA is effective for diagnosing or excluding PE in accordance with assessment of clinical pretest probability. When clinical probability is inconsistent with imaging results, further investigations are required to rule out PE.

## Pleural Effusions

### Definition

- excess amount of fluid in the pleural space (normally up to 25 mL)

### Etiology

- disruption of normal equilibrium between pleural fluid formation/entry and pleural fluid absorption/exit
- pleural effusions are classified as transudative or exudative
  - distinguish clinically using Light's Criteria (Table 23), which has a sensitivity of 98% and specificity of 83% for identifying exudative pleural effusions

**Table 23. Laboratory Values in Transudative and Exudative Pleural Effusion ("Light's Criteria and Modified Light's Criteria")**

	Light's Criteria	Modified Light's Criteria
Protein – pleural/serum	>0.5	>0.5
LDH – pleural/serum	>0.6	>0.6
Pleural LDH	>2/3 upper limit of N serum LDH	>0.45 upper limit of N serum LDH
Exudate = at least one criteria met		

Ann Intern Med 1979;77:507-513  
Chest 1997;111:970-980

### Transudative Pleural Effusions

- pathophysiology: alteration of systemic factors that affect the formation and absorption of pleural fluid (e.g. increased capillary hydrostatic pressure, decreased plasma oncotic pressure)
- etiology
  - CHF: usually right-sided or bilateral cirrhosis
  - nephrotic syndrome, protein losing enteropathy, cirrhosis
  - pulmonary embolism (may cause transudative but more often causes exudative effusion)
  - peritoneal dialysis, hypothyroidism, CF, urinothorax

### Exudative Pleural Effusions

- pathophysiology: increased permeability of pleural capillaries or lymphatic dysfunction
- etiology (see Table 24)

**Transudative** effusions are usually bilateral, not unilateral.

**Exudative** effusions can be bilateral or unilateral.

All criteria for transudate must be fulfilled to be considered a transudative effusion. If any one of the criteria for exudates is met – it is an exudate.

**Table 24. Exudative Pleural Effusion Etiologies**

Etiology	Examples
<b>Infectious</b>	Parapneumonic effusion (associated with bacterial pneumonia, lung abscess) Empyema (bacterial, fungal, TB) TB pleuritis Viral infection
<b>Malignancy</b>	Lung carcinoma (35%) Lymphoma (10%) Metastases: breast (25%), ovary, kidney Mesothelioma
<b>Inflammatory</b>	Collagen vascular diseases: RA, SLE Pulmonary embolism Post-CABG Drug reaction
<b>Intra-abdominal</b>	Subphrenic abscess Pancreatic disease (elevated pleural fluid amylase) Meigs' syndrome (ascites and hydrothorax associated with an ovarian fibroma or other pelvic tumour)
<b>Intra-thoracic</b>	Esophageal perforation (elevated fluid amylase)
<b>Trauma</b>	Chylothorax: thoracic duct disrupted and chyle accumulates in the pleural space, due to trauma, tumour Hemothorax: rupture of a blood vessel, commonly by trauma or tumours Pneumothorax (spontaneous, traumatic, tension)

### Signs and Symptoms

- often asymptomatic
- dyspnea: varies with size of effusion and underlying lung function
- pleuritic chest pain
- inspection: trachea deviates away from effusion, ipsilateral decreased expansion
- percussion: decreased tactile fremitus, dullness
- auscultation: decreased breath sounds, bronchial breathing and egophony at upper level, pleural friction rub

### Investigations

- CXR
  - must have >200 mL of pleural fluid for visualization on PA film
  - lateral: >50 mL leads to blunting of posterior costophrenic angle
  - PA: blunting of lateral costophrenic angle
  - dense opacification of lung fields with concave meniscus
  - decubitus: fluid will shift unless it is loculated
  - supine: fluid will appear as general haziness
- thoracentesis: indicated if pleural effusion is a new finding; be sure to send off blood work (LDH, glucose, protein) at the same time for comparison
  - risk of re-expansion pulmonary edema if >1.5 L of fluid is removed
  - inspect for colour, character, and odour of fluid
  - analyze fluid (see Tables 23 and 25)
- pleural biopsy: indicated if suspect TB, mesothelioma, or other malignancy (and if cytology negative)
- ± U/S: detects small effusions and can guide thoracentesis
- treatment depends on cause, ± drainage if symptomatic
- CT can be helpful in differentiating parenchymal from pleural abnormalities

**Table 25. Analysis of Pleural Effusion**

Measure	Purpose
Protein, LDH	Transudate vs. exudate (see Table 23)
Gram stain, Ziehl-Nielsen stain (TB), culture	Looking for specific organisms
Cell count differential	Neutrophils vs. lymphocytes (lymphocytic effusion in TB, cancer, lymphoma, serositis)
Cytology	Malignancy, infection
Glucose (low)	RA, TB, empyema, malignancy, esophageal rupture
Rheumatoid factor, ANA, complement	Collagen vascular disease
Amylase	Pancreatitis, esophageal perforation, malignancy
pH	Empyema <7.2, TB and mesothelioma <7.3
Blood	Mostly traumatic, malignancy, PE with infarction, TB
Triglycerides	Chylothorax from thoracic duct leakage, mostly due to trauma, lung CA, or lymphoma

#### Appearance of Pleural Fluid

- Bloody: trauma, malignancy
- White: chylothorax, empyema
- Black: aspergillosis, amoebic liver abscess
- Yellow-green: rheumatoid pleurisy
- Viscous: malignant mesothelioma
- Ammonia odour: urinothorax
- Food particles: esophageal rupture

#### Role of CT in Pleural Effusion

- To assess for fluid loculation, pleural thickening and nodules, parenchymal abnormalities and adenopathy
- Helps to distinguish benign from malignant effusion and transudative from exudative effusion
- May not distinguish empyema from parapneumonic effusion

#### Features of Malignant Effusion

- Multiple pleural nodules
- Nodular pleural thickening

#### Features of Exudative Effusion

- Loculation
- Pleural thickening
- Pleural nodules
- Extrapleural fat of increased density

**Treatment**

- thoracentesis
- treat underlying cause
- consider indwelling pleural catheter or pleurodesis in refractory effusions

**Complicated Parapneumonic Effusion**

- persistent bacteria in the pleural space, but fluid is non-purulent
- neutrophils, pleural fluid acidosis (pH <7.00), and high LDH
- often no bacteria grown, since rapidly cleared from pleural space
- fibrin layer leading to loculation of pleural fluid
- treatment: antibiotics and drainage, treat as an empyema

**Empyema****Definition**

- pus in pleural space or an effusion with organisms seen on a Gram stain or culture (i.e. pleural fluid is grossly purulent)
- positive culture is not required for diagnosis

**Etiology**

- contiguous spread from lung infection (most commonly anaerobes), or infection through chest wall (e.g. trauma, surgery)

**Signs and Symptoms**

- fever, pleuritic chest pain

**Investigations**

- CT chest
- thoracentesis
- PMNs (lymphocytes in TB) ± visible organisms on Gram stain

**Treatment**

- antibiotic therapy for at least 4-6 wk (rarely effective alone)
- complete pleural drainage with chest tube
- if loculated, more difficult to drain – may require surgical drainage video-assisted thorascopic surgery (VATS)

**Atelectasis**

- see [General Surgery](#), GS10

**Pneumothorax****Definition**

- presence of air in the pleural space

**Pathophysiology**

- increased intrapleural pressure reduces lung inflation

**Etiology**

- traumatic: penetrating or non-penetrating chest injuries
- iatrogenic (central venous catheter, thoracentesis, mechanical ventilation with barotrauma)
- spontaneous (no history of trauma)
  - primary (no underlying lung disease)
    - ♦ spontaneous rupture of apical subpleural bleb of lung into pleural space
    - ♦ predominantly tall, healthy, young males
  - secondary (underlying lung disease)
    - ♦ rupture of subpleural bleb which migrates along bronchioalveolar sheath to the mediastinum then to the intrapleural space
    - ♦ necrosis of lung tissue adjacent to pleural surface (e.g. pneumonia, abscess, PCP, lung CA, emphysema)

**Signs and Symptoms**

- can be asymptomatic
- acute-onset pleuritic chest pain, dyspnea
- tachypnea, tachycardia

**Pleural Effusions****Simple Effusion**

pH >7.2, LDH <1/2 serum, glucose >2.2

**Complicated Effusion**

pH <7.2, LDH >1/2 serum, glucose <2.2, positive Gram stain  
Needs drainage

When possible, organism-directed therapy, guided by culture sensitivities or local patterns of drug resistance, should be utilized.

**Need to Rule Out Life-Threatening Tension Pneumothorax**

If pneumothorax with:

- Severe respiratory distress
- Tracheal deviation to contralateral side
- Distended neck veins (↑ JVP)
- Hypotension

**Do not perform CXR.**

**Needs immediate treatment.**

See [Emergency Medicine](#), ER11

- tracheal deviation (contralateral deviation in tension pneumothorax)
- ipsilateral diminished chest expansion
- decreased tactile/vocal fremitus
- hyperresonance
- ipsilateral diminished breath sounds

### Investigations

- CXR
  - small: separation of visceral and parietal pleura seen as fine crescentic line parallel to chest wall at apex
  - large: increased density and decreased volume of lung on side of pneumothorax
  - see [Medical Imaging](#), MI8

### Treatment

- small pneumothoraces (<20% with no signs of respiratory/circulatory collapse) resolve spontaneously; breathing 100% oxygen accelerates resorption of air
- small intercostal tube with Heimlich valve for most spontaneous pneumothoraces
- large pneumothoraces or those complicating underlying lung disease require placement of a chest tube connected to underwater seal  $\pm$  suction
- for repeated episodes: pleurodesis with sclerosing agent or apical bullectomy and abrasion
- treat underlying cause (e.g. antibiotic for PCP)

## Asbestos-Related Pleural Disease and Mesothelioma

### Etiology and Pathophysiology

- benign manifestations of asbestos exposure
  - “benign asbestos pleural effusion”
    - ♦ exudative effusion, typically  $\approx$ 10 yr after exposure, resolves
  - pleural plaques, usually calcified
    - ♦ marker of exposure; usually an asymptomatic radiologic finding
- mesothelioma
  - primary malignancy of the pleura
  - decades after asbestos exposure (even with limited exposure)
  - smoking not a risk factor, but asbestos and smoking synergistically increase risk of lung cancer

### Signs and Symptoms

- persistent chest pain, dyspnea, cough, bloody pleural effusion, weight loss

### Investigations

- biopsy (pleuroscopic or open)
- needle biopsy may seed needle tract with tumour

### Treatment

- resection (extrapleural pneumonectomy) requires careful patient selection; rarely successful (average survival <1 yr)

## Respiratory Failure

### Definition

- failure of respiratory system to maintain normal blood gases
- hypoxemic ( $P_aO_2 < 60$  mmHg)
- hypercapnic ( $P_aCO_2 > 50$  mmHg)
- acute vs. chronic (compensatory mechanisms activated)

### Signs and Symptoms

- signs of underlying disease
- hypoxemia: restlessness, confusion, cyanosis, coma, cor pulmonale
- hypercapnia: headache, dyspnea, drowsiness, asterixis, warm periphery, plethora, increased ICP (secondary to vasodilatation)

### Investigations

- serial ABGs
- CXR and/or CT, bronchoscopy to characterize underlying cause if unclear

## Hypoxemic Respiratory Failure

### Definition

- $P_aO_2$  decreased,  $P_aCO_2$  normal or decreased

### Treatment

- reverse the underlying pathology
- oxygen therapy: maintain oxygenation (if shunt present, supplemental  $O_2$  is less effective; see [Anesthesia](#), A10, for oxygen delivery systems)
- ventilation, BiPAP and PEEP/CPAP (see *Mechanical Ventilation*, R26): positive pressure can recruit alveoli and redistribute lung fluid
- improve cardiac output:  $\pm$  hemodynamic support (fluids, vasopressors, inotropes), reduction of  $O_2$  requirements

Table 26. Approach to Hypoxemia

Type of Hypoxemia	Settings	$P_aCO_2$	A-a $DO_2$	Oxygen Therapy	Ventilation, BiPAP and PEEP	Improved Cardiac Output
1. Low $F_iO_2$	Postop, high altitude	N or ↓	N	Improves	No change	No change
2. Hypoventilation	Drug overdose	↑	N	Improves	Improves with ventilation	No change
3a. Shunt	ARDS, pneumonia	N or ↓	↑	No change	Improves (except if one-sided)	Improves
3b. Shunt (Right to Left)	Pulmonary HTN	N or ↓	↑	No change	Worsens	Worsens
4. Low mixed venous $O_2$ content	Shock	↓	↑	Improves or no change	Worsens	Improves
5. V/Q mismatch	COPD	N or ↑	↑	Improves (small amounts)	Often improves	Improves
6. Diffusion impairment	ILD, emphysema	N	↑	Improves	Improves with positive pressure	No change or worsens

Reprinted with permission from Dr. Ian Fraser

#### Causes of Hypoxemia

- Low  $F_iO_2$
- Hypoventilation
- Shunting
- Low mixed venous  $O_2$  content
- V/Q mismatch

## Hypercapnic Respiratory Failure

- $P_aCO_2$  increased,  $P_aO_2$  decreased

### Pathophysiology

- increased  $CO_2$  production: fever, sepsis, seizure, acidosis, carbohydrate load
- alveolar hypoventilation: COPD, asthma, CF, chest wall disorder, dead space ventilation (rapid shallow breathing)
  - i.e. inefficient gas exchange results in inadequate  $CO_2$  removal in spite of normal or increased minute volume
- hypoventilation
  - central: brainstem stroke, hypothyroidism, severe metabolic alkalosis, drugs (opiates, benzodiazepines)
  - neuromuscular: myasthenia gravis, Guillain-Barré, phrenic nerve injury, muscular dystrophy, polymyositis, kyphoscoliosis
  - muscle fatigue

### Treatment

- reverse the underlying pathology
- if  $P_aCO_2 > 50$  mmHg and pH is acidemic consider noninvasive or mechanical ventilation
- correct exacerbating factors
  - NTT/ETT suction: clearance of secretions
  - bronchodilators: reduction of airway resistance
  - antibiotics: treatment of infections
- maintain oxygenation (see above)
- diet: increased carbohydrate can increase  $P_aCO_2$  in those with mechanical or limited alveolar ventilation; high lipids decrease  $P_aCO_2$

#### Dead Space

- Ventilation without perfusion
- The opposite of shunt

#### Causes of Hypercapnia

- High Inspired  $CO_2$
- Low Total Ventilation
- High Deadspace Ventilation
- High  $CO_2$  Production

In chronic hypercapnia, supplemental  $O_2$  may decrease the hypoxic drive to breathe, but do not deny oxygen if the patient is hypoxic.

In COPD patients with chronic hypercapnia ("CO<sub>2</sub> retainers"), provide supplemental oxygen to achieve target  $SpO_2$  from 88-92%.

## Acute Respiratory Distress Syndrome (ARDS)

- clinical syndrome characterized by severe respiratory distress, hypoxemia, and noncardiogenic pulmonary edema
- The Berlin Criteria (*JAMA* 2012; 307:2526-2533) for ARDS:
  - acute onset
    - within 7 d of a defined event, such as sepsis, pneumonia, or patient noticing worsening of respiratory symptoms
      - usually occurs within 72 h of presumed trigger
  - bilateral opacities consistent with pulmonary edema on either CT or CXR
  - not *fully* explained by cardiac failure/fluid overload, but patient may have concurrent heart failure
  - an objective assessment (e.g. echocardiogram) should be performed if no clear risk factors

### Etiology

- direct lung injury:
  - airway: aspiration (**gastric contents**, drowning), **pneumonia**, inhalation injury (oxygen toxicity, nitrogen dioxide, smoke)
  - circulation: embolism (fat, amniotic fluid), reperfusion injury
- indirect lung injury
  - circulation: **sepsis**, **shock**, **trauma**, blood transfusion, pancreatitis
  - neurogenic: head trauma, intracranial hemorrhage, drug overdose (narcotics, sedatives, TCAs)

### Pathophysiology

- disruption of alveolar capillary membranes → leaky capillaries → interstitial and alveolar pulmonary edema → reduced compliance, V/Q mismatch, shunt, hypoxemia, pulmonary HTN

### Clinical Course

#### A. Exudative Phase

- first 7 d of illness after exposure to ARDS precipitant
- alveolar capillary endothelial cells and type I pneumocytes are injured, resulting in loss of normally tight alveolar barrier
- patients develop dyspnea, tachypnea, increased work of breathing
  - these result in respiratory fatigue and eventually respiratory failure (see *Hypoxemic Respiratory Failure*, R25)

#### B. Fibroproliferative Phase

- after day 7
- may still experience dyspnea, tachypnea, fatigue, and hypoxemia
- most patients clinically improve and are able to wean off mechanical ventilation
- some patients develop fibrotic lung changes that may require long-term support on supplemental oxygen or even mechanical ventilation
- if fibrosis present, associated with increased mortality

### Treatment

- based on ARDS network (see *Landmark Respiriology Trials*, R35)
- treat underlying disorder (e.g. antibiotics if infection present)
- mechanical ventilation using low tidal volumes (<6 mL/kg) to prevent barotrauma
  - use optimal amount of PEEP (positive end-expiratory pressure) to keep airways open and allow the use of lower  $F_{iO_2}$
  - may consider using prone ventilation, and/or inhaled nitric oxide, high frequency oscillator or ECMO (extracorporeal membrane oxygenation) if conventional treatment is failing
- fluids and inotropic therapy (e.g. dopamine, vasopressin) if cardiac output inadequate
- pulmonary-arterial catheter now seldom used for monitoring hemodynamics
- mortality: 30-40%, usually due to non-pulmonary complications
- sequelae of ARDS include residual pulmonary impairment, severe debilitation, polyneuropathy and psychologic difficulties, which gradually improve over time
- most survivors eventually regain near-normal lung function, often with mildly reduced diffusion capacity

**ALI versus ARDS:** Definition is the same, except ALI is a  $P_{aO_2}/F_{iO_2} \leq 300$ , while ARDS is a  $P_{aO_2}/F_{iO_2} \leq 200$

**Categorization of ARDS as Mild, Moderate or Severe – The Berlin Criteria**

ARDS Severity	$P_{aO_2}/F_{iO_2}$ * (mmHg)	Mortality (95% CI)†
Mild	200-300	27 (24-30)%
Moderate	100-200	32 (29-34)%
Severe	<100	45 (42-48)%

\*on  $\geq 5$  cm  $H_2O$  PEEP; †P < 0.001

*JAMA* 2012;307:2526-2533

**Risk Factors for Aspiration Pneumonia**

Categories	Examples
Decreased level of consciousness	Alcoholism
Upper GI tract disorders	Dysphagia, esophageal disorders
Mechanical instrumentation	Intubation, nasogastric tube, feeding tubes
Neurologic conditions	Dementia, Parkinson disease
Others	Protracted vomiting

## Mechanical Ventilation

- see [Anesthesia](#), A10

### Definition

- artificial means of supporting ventilation and oxygenation
- mechanically ventilated patients may require some sedation and/or analgesia

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse.

## Indications

- general indications
  - hypoxemic respiratory failure
  - hypercapnic respiratory failure
- specific indicators for mechanical ventilation
  - acute ventilation failure/acute respiratory acidosis
  - refractory hypoxemia
  - reduced level of consciousness
  - facilitation of surgical procedures

## Ventilator Strategies

- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

## Modes of Ventilation

- assist-control ventilation (ACV)
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a preset constant inspiratory pressure
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and pediatric respiratory failure
  - used in adults when conventional mechanical ventilation is failing.
- noninvasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask with:
    - ♦ BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration
    - ♦ CPAP: delivers constant pressure on both inspiration and expiration

## Complications of Mechanical Ventilation

- airway complications
  - tracheal stenosis, laryngeal edema
- alveolar complications
  - ventilator-induced lung injury, ventilator-associated pneumonia (nosocomial pneumonia), barotrauma, volutrauma, inflammation, auto-PEEP, patient-ventilator asynchrony
- cardiovascular complications
  - reduced venous return, reduced cardiac output, hypotension
- neuromuscular complications
  - muscle atrophy
  - increased intracranial pressure

### Tracheostomy

- Tracheostomy should be considered in patients who require ventilator support for extended periods of time
- Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

### Positive End Expiratory Pressure (PEEP)

- Positive pressure applied at the end of ventilation which opens up collapsed alveoli decreasing V/Q mismatch
- Used with all invasive modes of ventilation

### Monitoring Ventilatory Therapy

- Pulse oximetry, end-tidal CO<sub>2</sub> concentration
- Regular arterial blood gases
- Assess tolerance regularly

Management of pneumothorax in patients on mechanical ventilation → chest tube.

### A Comparison of Four Methods of Weaning Patients from Mechanical Ventilation

*NEJM* 1995;332:345-350

**Study:** Prospective, randomized, multicenter trial.  
**Participants:** 130 of 546 patients who received mechanical ventilation and were considered ready for weaning but had respiratory distress during a 2 h trial of spontaneous breathing

**Intervention:** One of four weaning techniques following standardized protocol.

**Outcome:** Median duration of weaning.

**Results:** The median duration of weaning for intermittent mandatory ventilation, pressure-support ventilation, intermittent (multiple) trials of spontaneous breathing, and once-daily trial of spontaneous breathing was 5 d, 4 d, and 3 d respectively. The rate of successful weaning was higher with once-daily trial of spontaneous breathing than with intermittent mandatory ventilation (rate ratio 2.83; 95%CI 1.36 to 5.89;  $p < 0.006$ ) or pressure-support ventilation (ratio 2.05; 95%CI 1.04 to 4.04;  $p < 0.04$ ). There was no significant difference in the rate of success between once-daily trials and multiple trials of spontaneous breathing.

**Conclusions:** Once-daily or multiple trials of spontaneous breathing led to extubation more quickly than intermittent mandatory or pressure-support ventilation.

# Neoplasms

## Lung Cancer

### Classification

- lung tumours can be classified as primary or secondary, benign or malignant, endobronchial or parenchymal
- bronchogenic carcinoma (epithelial lung tumours) are the most common type of primary lung tumour (other types make up less than 1%)
  - small cell lung cancer (SCLC)
  - non-small-cell lung cancer (NSCLC)
    - ♦ squamous cell carcinoma: arise from the proximal respiratory epithelium
    - ♦ adenocarcinoma: incidence is increasing; most common subtype in nonsmokers
      - bronchoalveolar carcinoma: grows along the alveolar wall in the periphery; may arise at sites of previous lung scarring
    - ♦ large cell undifferentiated cancer: diagnosis of exclusion
- benign epithelial lung tumours can be classified as papillomas or adenomas

**Table 27. Characteristics of Bronchogenic Cancer**

Cell Type	Incidence	Correlation with Smoking	Location	Histology	Metastasis
<b>Adenocarcinoma</b>	M: 35% F: 40%	Weak	Peripheral	Glandular, mucin producing	Early, distant
<b>Squamous cell carcinoma (SCC)</b>	30%	Strong	Central	Keratin, intercellular bridges	Local invasion and distant spread, may cavitate
<b>SCLC</b>	25%	Strong	Central	Oat cell, neuroendocrine	Disseminated at presentation Origin in endobronchial cells
<b>Large cell carcinoma</b>	10-15%	Strong	Peripheral	Anaplastic, undifferentiated	Early, distant

**Risk Factors**

- cigarette smoking: the relative risk of developing lung cancer is 10-30 times higher for smokers than for nonsmokers
- other risk factors include cigar smoking, pipe smoking, second-hand smoke, asbestos without smoking (relative risk is 5), asbestos with smoking (relative risk is 92), metals (e.g. chromium, arsenic, nickel), radon gas, ionizing radiation, genetics

**Signs and Symptoms**

- may be due to primary lesion, metastasis, or paraneoplastic syndrome
- primary lesion:
  - cough (75%): beware of chronic cough that changes in character
  - dyspnea (60%)
  - chest pain (45%)
  - hemoptysis (35%)
  - other pain (25%)
  - clubbing (21%)
  - constitutional symptoms: anorexia, weight loss, fever, anemia
- metastasis
  - lung, hilum, mediastinum, pleura: pleural effusion, atelectasis, wheezing
  - pericardium: pericarditis, pericardial tamponade
  - esophageal compression: dysphagia
  - phrenic nerve: paralyzed diaphragm
  - recurrent laryngeal nerve: hoarseness
  - superior vena cava syndrome:
    - obstruction of SVC causing neck and facial swelling, as well as dyspnea and cough
    - other symptoms: hoarseness, tongue swelling, epistaxis, and hemoptysis
    - physical findings: dilated neck veins, increased number of collateral veins covering the anterior chest wall, cyanosis, edema of the face, arms, and chest, Pemberton's sign (facial flushing, cyanosis, and distension of neck veins upon raising both arms above head)
    - milder symptoms if obstruction is above the azygos vein
  - lung apex (Pancoast tumour): Horner's syndrome, brachial plexus palsy (most commonly C8 and T1 nerve roots)
  - rib and vertebrae: erosion
  - distant metastasis to brain, bone, liver, adrenals
- paraneoplastic syndromes (see Table 28)
  - a group of disorders associated with malignant disease, not related to the physical effects of the tumour itself
  - most often associated with SCLC

**Table 28. Paraneoplastic Syndromes**

System	Clinical Presentation	Associated Malignancy
<b>Skeletal</b>	Clubbing, hypertrophic pulmonary osteoarthropathy (HPOA)	NSCLC
<b>Dermatologic</b>	Acanthosis nigricans Dermatomyositis	Bronchogenic cancer Bronchogenic cancer
<b>Endocrine</b>	Hypercalcemia (osteolysis or PTHrP) Hypophosphatemia Hypoglycemia Cushing's syndrome (ACTH) Somatostatinoma syndrome SIADH	Squamous cell cancer Squamous cell cancer Sarcoma SCLC Bronchial carcinoid SCLC
<b>Neuromyopathic</b>	Lambert-Eaton syndrome Polymyositis Subacute cerebellar degeneration Spinocerebellar degeneration Peripheral neuropathy	SCLC
<b>Vascular/ Hematologic</b>	Nonbacterial endocarditis Trousseau's syndrome (migratory thrombophlebitis) DIC	Bronchogenic cancer NSCLC
<b>Renal</b>	Nephrotic syndrome	

**Summary of Recommendations on Screening for Lung Cancer****Canadian Task Force on Preventive Health Care (2003)****Screening with CXR**  
Not recommended**Screening with low-dose CT**  
Insufficient evidence to make recommendation**American College of Chest Physicians (2013)****Screening with CXR**  
Not recommended**Screening with low-dose CT**  
Recommended for high-risk patients (current or former smokers quit within last 15 yr, aged 55-74, ≥30 pack-yr smoking Hx)**American Lung Association (2013)****Screening with CXR**  
Not recommended**Screening with low-dose CT**  
Recommended for high-risk patients (current or former smokers aged 55-74, ≥30 pack-yr smoking Hx, no Hx of lung cancer)**Reduced Lung-cancer Mortality with Low-dose CT Screening**

NEJM 2011;365:395-409  
Study: Multicenter, RCT.

**Methods:** 53,454 participants at high risk for lung cancer (55-74 yr, >30 yr smoking, and smoking cessation for <5 yr) were assigned to undergo three annual screenings with either low dose CT or single-view PA CXR.

**Results:** A relative reduction in mortality from lung cancer with low-dose CT screening of 20.0% (95%CI, 6.8 to 26.7; p=0.004). Rate of death from any cause was reduced in the low-dose CT group as compared to the CXR group by 6.7% (95%CI, 1.2 to 13.6; p=0.02).

	Low-dose CT	CXR
Rate of positive screening test	24.2%	6.9%
False positives	96.4%	94.5%
Incidence of lung cancer	645/100K person yr	572/100K person yr
Deaths from lung cancer	247/100K person yr	309/100K person yr

**Conclusions:** Screening with low-dose CT reduces mortality from lung cancer.

Malignant lung tumours are the most common cause of cancer mortality throughout the world in both men and women.

**Endobronchial Ultrasound (EBUS):**

- Allows visualization of peri-bronchial structures and distal peripheral lung lesions
- Provides detailed assessment of the airway wall layers
- Allows for guided biopsies of lymph nodes and tumours
- Used for diagnosis and staging

## Investigations

- initial diagnosis
  - imaging: CXR, CT chest + upper abdomen, PET scan, bone scan
  - cytology: sputum
  - biopsy: bronchoscopy, percutaneous mediastinoscopy
- staging work-up
  - TMN staging system: T – primary tumour (size); N – regional lymph nodes; M – distant metastasis
  - blood work: electrolytes, LFTs, calcium, ALP
  - imaging: CXR, CT thorax and upper abdomen, bone scan, neuroimaging
  - invasive: bronchoscopy (EBUS), mediastinoscopy, mediastinotomy, thoracotomy

**Table 29. SCLC vs. NSCLC**

	Stage	Definition	Treatment	Median Survival
<b>SCLC</b>	Limited stage	Confined to single radiation port (one hemithorax and regional lymph nodes)	Radiation ± chemo ± prophylactic to brain	1-2 yr (12 wk without treatment)
	Extensive stage	Extension beyond a single radiation port	Chemotherapy	6 mo (5 wk without treatment)
	Stage	TNM	Treatment	5 Yr Survival (%)*
<b>NSCLC</b>	IA	T1a-1bN0M0	1st line is complete surgical resection with possible post-op adjuvant chemotherapy with stage IB and stage II. Radiotherapy for non-surgical candidates.	50-73
	IB	T2aN0M0		43-58
	IIA	T1a-T2a,N1M0 or T2bN0M0		36-46
	IIB	T2bN1M0 or T3N0M0	Combined modality approach (concurrent chemotherapy followed by surgery)	25-36
	IIIA	T1a-T2bN2M0 or T3N1-2M0 or T4N0-1M0		19-24
	IIIB	T4N2M0 or T1-4N3M0		7-9
	IV	T1-4N0-3M1a-1b	Systemic therapy or molecularly targeted therapy or symptom-based palliative management (radiation). Isolated metastasis may be resected.	2-13

\* Depends on clinical vs. pathologic stage

Refer to *AJCC Cancer Staging Manual*, 7th ed. (2010) for complete TNM classification

## Treatment

- options include surgery, radiotherapy, chemotherapy, and palliative care for end-stage disease (see Table 29)
- surgery not usually performed for SCLC since it is generally non-curable
- contraindications for surgery:
  - spread to contralateral lymph nodes or distant sites
    - patients with potentially resectable disease must undergo mediastinal node sampling since CT thorax is not accurate in 20-40% of cases
  - poor pulmonary status (e.g. unable to tolerate resection of lung)
- chemotherapy (used in combination with other treatments)
  - common agents: etoposide, platinum agents (e.g. cisplatin), ifosfamide, vincristine, anthracyclines, paclitaxel, irinotecan, gefitinib (an endothelial growth factor receptor inhibitor)
  - complications:
    - acute: tumour lysis syndrome, infection, bleeding, myelosuppression, hemorrhagic cystitis (cyclophosphamide), cardiotoxicity (doxorubicin), renal toxicity (cisplatin), peripheral neuropathy (vincristine)
    - chronic: neurologic damage, leukemia, additional primary neoplasms

## Prognosis

- 5 yr survival rates for different subtypes:
  - squamous cell carcinoma 25%
  - adenocarcinoma 12% (60% for bronchoalveolar carcinoma, a subtype of adenocarcinoma, with a resectable solitary lesion)
  - large cell carcinoma 13%
  - SCLC 1% (poorest prognosis)
  - NSCLC (see Table 29)

## Prevention

- smoking cessation
- avoidance of exposures
- early detection

### Horner has a MAP of the Coast

A Pancoast tumour compresses the cervical sympathetic plexus causing a Horner's syndrome:

Miosis  
Anhydrosis  
Ptosis

2/3 of primary lung cancer is found in the upper lung; 2/3 of metastases occur in the lower lung (hematogenous spread secondary to increased blood flow to the base of the lung).

Combination treatment may be superior, giving better response rates.

## Approach to the Solitary Pulmonary Nodule

- also see [Medical Imaging](#), MI7

### Definition

- a round or oval, sharply circumscribed radiographic lesion up to 3-4 cm, which may or may not be calcified, and is surrounded by normal lung
- can be benign or malignant

**Table 30. Differential Diagnosis for Benign vs. Malignant Solitary Nodule**

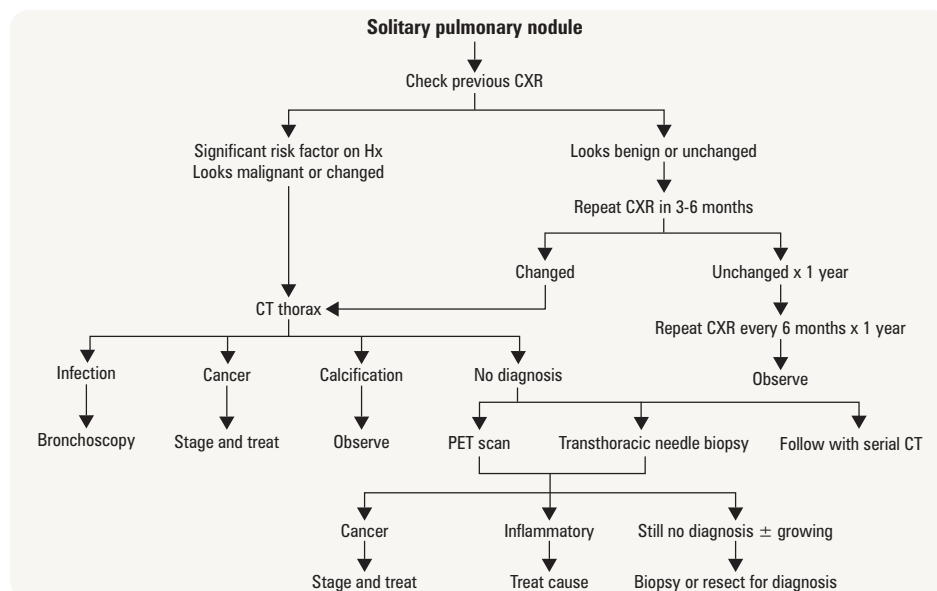

Benign (70%)	Malignant (30%)
<b>Infectious granuloma</b> (histoplasmosis, coccidiomycosis, TB, atypical mycobacteria) <b>Other infections</b> (bacterial abscess, PCP, aspergilloma) <b>Benign neoplasms</b> (hamartoma, lipoma, fibroma) <b>Vascular</b> (AV malformation, pulmonary varix) <b>Developmental</b> (bronchogenic cyst) <b>Inflammatory</b> (granulomatosis with polyangiitis, rheumatoid nodule, sarcoidosis) <b>Other</b> (hematoma, infarct, pseudotumour, rounded atelectasis, lymph nodes, amyloidoma, hamartoma)	<b>Bronchogenic carcinoma</b> Adenocarcinoma Squamous cell carcinoma Large cell carcinoma Small cell carcinoma <b>Metastatic lesions</b> Breast Head and neck Melanoma Colon Kidney Sarcoma Germ cell tumours <b>Pulmonary carcinoid</b>

### Investigations (see Figure 11)

- CXR: always compare with previous CXR (see Table 31)
- CT densitometry and contrast enhanced CT of thorax
- sputum cytology: usually poor yield
- biopsy (bronchoscopic or percutaneous) or excision (thoracoscopy or thoracotomy): if clinical and radiographic features do not help distinguish between benign or malignant lesion
  - if at risk for lung cancer, biopsy may be performed regardless of radiographic features
  - if a biopsy is non-diagnostic, whether to observe, re-biopsy or resect will depend on the level of suspicion
- watchful waiting: repeat CXR and/or CT scan at 3, 6, 12 mo
- PET scan can help distinguish benign from malignant nodules

**Table 31. CXR Characteristics of Benign vs. Malignant Solitary Nodule**

Parameters	Benign	Malignant
<b>Size</b>	<3 cm, round, regular	>3 cm, irregular, spiculated
<b>Margins</b>	Smooth margin	Ill-defined or notched margin
<b>Features</b>	Calcified pattern: central, "popcorn" pattern if hamartoma, usually no cavitation; if cavitated, wall is smooth and thin, no other lung pathology	Usually not calcified; if calcified, pattern is eccentric, no satellite lesions, cavitation with thick wall, may have pleural effusions, lymphadenopathy
<b>Doubling Time</b>	Doubles in <1 mo or >2 yr	Doubles in >1 mo or <2 yr

**Figure 11. Evaluation of a solitary pulmonary nodule**

### Carcinoids

- Early onset (40-60 yr)
- Most are central and can produce symptoms and signs of bronchial obstruction
- Hemoptysis is present in approximately 50% of cases

### Hamartomas

- 10% of benign lung lesions
- Composed of tissues normally present in lung (fat, epithelium, fibrous tissue and cartilage), but they exhibit disorganized growth
- Peak incidence is age 60, more common in men
- Usually peripheral and clinically silent
- CXR shows clustered "popcorn" pattern of calcification (pathognomonic for hamartoma)

Pulmonary neoplasms may present as a solitary pulmonary nodule identified incidentally on a radiographic study (~10% of cases) or as symptomatic disease (most cases).

Adenocarcinoma present in a non-smoker is usually due to endothelial growth factor receptor mutation.

### Corona Radiata Sign on Chest CT

- Fine striations that extend linearly from a nodule in a spiculated fashion
- Highly associated with malignancy

### Terminology

- "nodule" <3 cm
- "mass" >3 cm

# Sleep-Related Breathing Disorders

## Hypoventilation Syndromes

- primary alveolar hypoventilation: idiopathic
- obesity-hypoventilation syndrome (Pickwickian syndrome)
- respiratory neuromuscular disorders

## Sleep Apnea

### Definition

- episodic decreases in airflow during sleep
- quantitatively measured by the Apnea/Hypopnea Index (AHI) = # of apneic and hypopneic events per hour of sleep
- sleep apnea generally accepted to be present if AHI >15

### Classification

- obstructive (OSA)
  - caused by transient, episodic obstruction of the upper airway
  - absent or reduced airflow despite persistent respiratory effort
- central (CSA) (see [Neurology](#), N42)
  - caused by transient, episodic decreases in CNS drive to breathe
  - no airflow because no respiratory effort
  - Cheyne-Stokes Respiration: a form of CSA in which central apneas alternate with hyperpneas to produce a crescendo-decrescendo pattern of tidal volume; seen in severe LV dysfunction, brain injury, and other settings (Figure 2)
- mixed (MSA)
  - features of both OSA and CSA
  - loss of hypoxic and hypercapnic drives to breathe secondary to "resuscitative breathing": overcompensatory hyperventilation upon awakening from OSA induced hypoxia

### Risk Factors

- for OSA: obesity, upper airway abnormality, neuromuscular disease, hypothyroidism, alcohol/sedative use, nasal congestion, sleep deprivation
- for CSA: LV failure, brainstem lesions, encephalitis, encephalopathy, myxedema, high altitude

### Signs and Symptoms

- obtain history from spouse/partner
- secondary to repeated arousals and fragmentation of sleep: daytime somnolence, personality and cognitive changes, snoring
- secondary to hypoxemia and hypercapnia: morning headache, polycythemia, pulmonary/systemic HTN, cor pulmonale/CHF, nocturnal angina, arrhythmias
- the typical presentation for OSA is a middle-aged obese male who snores
- CSA can be due to neurological disease

### Investigations

- sleep study (polysomnography)
  - evaluates sleep stages, airflow, ribcage movement, ECG, SaO<sub>2</sub>, limb movements
  - indications
    - ♦ excessive daytime sleepiness
    - ♦ unexplained pulmonary HTN or polycythemia
    - ♦ daytime hypercapnia
    - ♦ titration of optimal nasal CPAP
    - ♦ assessment of objective response to other interventions

### Treatment

- modifiable factors: weight loss, decreased alcohol/sedatives, nasal decongestion, treatment of underlying medical conditions
- OSA or MSA: nasal CPAP, postural therapy (i.e. no supine sleeping), dental appliance, uvulopalatopharyngoplasty, tonsillectomy
- CSA or hypoventilation syndromes: nasal BiPAP/CPAP, respiratory stimulants (e.g. progesterone) in select cases
- tracheostomy rarely required and should be used as last resort for OSA

### Complications

- depression, weight gain, decreased quality of life, workplace and vehicular accidents, cardiac complications (e.g. HTN), reduced work/social function

#### Normal Respiratory Changes during Sleep

- Tidal volume decreases
- Arterial CO<sub>2</sub> increases (due to decreased minute ventilation)
- Pharyngeal dilator muscles relax causing increased upper airway resistance

**Apnea:** absence of breathing for ≥10 s.

**Hypopnea:** excessive decrease in rate or depth of breathing (>50% reduction in ventilation).

**Hyperpnea:** excessive increase in rate or depth of breathing.

#### Continuous Positive Airways Pressure for Obstructive Sleep Apnea

*Cochrane DB Syst Rev 2006;CD001106*

**Study:** Pooled analysis of 36 RCTs (n=1718) comparing nocturnal CPAP with an inactive control or oral appliances in adults with OSA.

**Conclusions:** The use of CPAP showed significant improvements in objective and subjective measures including cognitive function, sleepiness, measures of quality of life, and a lower average systolic and diastolic blood pressure. People who responded equally well to CPAP and oral appliances expressed a strong preference for oral appliances; however, participants on oral appliances were more likely to withdraw from therapy.

CPAP has been shown to reduce cardiovascular risk and cardiovascular related deaths in patients with obstructive sleep apnea.

## Introduction to Intensive Care

- goal is to provide stabilization for critically ill patients: hemodynamic, respiratory or cardiac instability, or need for close monitoring

### ICU Basics

#### Lines and Catheters

- arterial lines
  - monitor beat-to-beat blood pressure variations, obtain blood for routine ABGs
  - common sites are the radial and femoral arteries
- central venous catheter (central line)
  - administer IV fluids, monitor CVP, insert pulmonary artery catheters
  - administer TPN and agents too irritating for peripheral line
  - common sites: internal jugular vein, subclavian vein, femoral vein
- pulmonary arterial catheter
  - balloon guides the catheter from a major vein to the right heart
  - measures pulmonary capillary wedge pressure (PCWP) via a catheter wedged in distal pulmonary artery
  - PCWP reflects the LA and LV diastolic pressure (barring pulmonary venous or mitral valve disease)
  - indications (N.B. now used infrequently due to associated complications):
    - ♦ diagnosis of shock states, primary pulmonary HTN, valvular disease, intracardiac shunts, cardiac tamponade, PE
    - ♦ assessment of hemodynamic response to therapies
    - ♦ differentiation of high- versus low-pressure pulmonary edema
    - ♦ management of complicated MI, multiorgan system failure and/or severe burns, or hemodynamic instability after cardiac surgery
  - absolute contraindications:
    - ♦ tricuspid or pulmonary valve mechanical prosthesis
    - ♦ right heart mass (thrombus or tumour)
    - ♦ tricuspid or pulmonary valve endocarditis

**Table 32. Useful Equations and Cardiopulmonary Parameters**

$BSA = [Ht (cm) + Wt (kg) - 60]/100$	$PCWP = LVEDP$
$SV = CO / HR$	$SVI = CI / HR$
$CI = CO / BSA$	$RV \text{ Ejection Fraction} = SV / RVEDV$
$SVRI = [(MAP - RAP) 80]/CI$	$PP = sBP - dBP$
$P:F \text{ ratio} = P_{aO_2} / F_{iO_2}$	$MAP = 1/3 sBP + 2/3 dBP = dBP + 1/3 PP$

BSA = body surface area; CI = cardiac index; CO = cardiac output; DBP = diastolic blood pressure; HR = heart rate; LVEDP = left ventricular end diastolic pressure; MAP = mean arterial pressure; PCWP = pulmonary capillary wedge pressure; PP = pulse pressure; RAP = right atrial pressure; RVEDV = right ventricular end diastolic volume; SBP = systolic blood pressure; SV = stroke volume; SVI = stroke volume index; SVRI = systemic vascular resistance index

#### ICU Psychosis

A form of delirium or acute brain failure that occurs in ICU patients. Signs and symptoms may include anxiety, agitation, paranoia, hallucinations, and disorientation in time and place. Treatment varies with cause.

#### Intensive Insulin Therapy in Critically Ill Patients

NEJM 2001;345:1359-1367

**Study:** Prospective, randomized controlled clinical outcome study.

**Patients:** 1548 patients admitted to the ICU.

**Intervention:** At admission, patients were randomly assigned to either intensive insulin therapy or conventional therapy. Those in the intensive group had an infusion started if BG exceeded 6.1 mmol/L, and maintained to keep BG between 4.4 to 6.1 mmol/L.

Those in the conventional group were started on insulin only if BG exceeded 11.9, and the infusion was adjusted for a target between 10.0 and 11.1 mmol/L.

**Primary Outcome:** Death from any cause during ICU stay.

**Results:** 35 patients (4.6%) died in the intensive group in the ICU, versus 63 patients (8.0%) in the conventional group. This represents a 32% mortality reduction ( $p=0.04$ ). Intensive insulin therapy also reduced overall in-hospital mortality, lowered deaths due to sepsis, multi-organ failure. Most of the mortality benefit was seen in long stay patients ( $>5$  d).

**Conclusion:** Intensive insulin therapy in the ICU reduces mortality by 32%, and improves in-hospital mortality and morbidity.

## Organ Failure

**Table 33. Types of Organ Failure**

Type of Failure	Clinical Presentation	Treatment
<b>Respiratory Failure</b> (see <i>Respiratory Failure</i> , R24)	Hypoxemia Hypercapnea	Treat underlying cause (e.g. lung disease, shunt, V/Q mismatch, drug-related, cardiac) Manage mechanical ventilation settings Supplemental oxygen
<b>Cardiac Failure</b> (see <i>Cardiology</i> , C30) 	Hypotension Decreased urine output Altered mental status Arrhythmia Hypoxia	Treat underlying cause (e.g. bradycardia, tachycardia, blood loss, adrenal insufficiency) Volume resuscitation Vasopressors Inotropes Intra-aortic balloon pump
<b>Coagulopathy</b> (see <i>Hematology</i> , H34)	Increased INR or PTT Low platelet count Bleeding, bruising	Treat underlying cause (e.g. thrombocytopenia, drug-related, immune-related, DIC) Transfusion of blood product, clotting factors
<b>Liver Failure</b> (see <i>Gastroenterology</i> , G36)	Elevated transaminases, bilirubin Coagulopathy Jaundice Mental alteration (encephalopathy) Hypoglycemia	Treat underlying cause (e.g. viral hepatitis, drug related, metabolic) Liver transplant Lactulose
<b>Renal Failure</b> (see <i>Nephrology</i> , NP35)	Elevated creatinine Reduced urine output Signs of volume overload (e.g. CHF, effusions)	Treat underlying cause (e.g. shock, drug-related, obstruction) Correct volume and electrolyte status, eliminate toxins Diuretics Dialysis

## Shock

- see [Emergency Medicine](#), ER3
- inadequate tissue perfusion potentially resulting in end organ injury
  - categories of shock:
    - ♦ hypovolemic: hemorrhage, dehydration, vomiting, diarrhea, interstitial fluid redistribution
    - ♦ cardiogenic: myopathic (myocardial ischemia ± infarction), mechanical, arrhythmic, pharmacologic
    - ♦ obstructive: massive PE (saddle embolus), pericardial tamponade, constrictive pericarditis, increased intrathoracic pressure (e.g. tension pneumothorax)
    - ♦ distributive: sepsis, anaphylactic reaction, neurogenic, endocrinologic, toxic

**Table 34. Changes Seen in Different Classes of Shock**

	Hypovolemic	Cardiogenic	Obstructive	Distributive
HR	↑	↑, N, or ↓	↑	↑
BP	↓	↓	↓	↓
JVP	↓	↑	↑	↓
Extremities	Cold	Cold	N or Cold	Warm
Other	Look for visible hemorrhage or signs of dehydration	Bilateral crackles on chest exam	Depending on cause, may see pulsus paradoxus, Kussmaul's sign, or tracheal deviation	Look for obvious signs of infection or anaphylaxis

- treat underlying cause
- treatment goal is to return critical organ perfusion to normal (e.g. normalize BP)
- common treatment modalities include:
  - fluid resuscitation
  - inotropes (e.g. dobutamine), vasopressors (e.g. norepinephrine), vasopressin
  - revascularization or thrombolytics for ischemic events

### Shock: Clinical Correlation

**Hypovolemic:** patients have cool extremities due to peripheral vasoconstriction.

**Cardiogenic:** patients usually have signs of left-sided heart failure.

**Obstructive:** varied presentation.

**Distributive:** patients have warm extremities due to peripheral vasodilation.

### Causes of SHOCK

Spinal (neurogenic), Septic Hemorrhagic

**Obstructive** (e.g. tension pneumothorax, cardiac tamponade, PE)

**Cardiogenic** (e.g. arrhythmia, MI) **Anaphylactic**

## Sepsis

- the leading cause of death in noncoronary ICU settings is multi-organ failure due to sepsis
- the predominant theory is that sepsis is attributable to uncontrollable immune system activation

### Definitions

- sepsis: the presence of both infection and SIRS (see Table 35)
- severe sepsis: sepsis associated with organ dysfunction, hypoperfusion or hypotension
- septic shock: sepsis with arterial hypotension despite adequate fluid resuscitation
- multiorgan dysfunction syndrome: sepsis in the presence of altered organ function such that homeostasis cannot be maintained without intervention

### Signs and Symptoms

**Table 35. Clinical Manifestations of Sepsis**

General Variables	Organ Dysfunction Variables
Fever ( $>38^{\circ}\text{C}$ ) or hypothermia ( $<36^{\circ}\text{C}$ )	Arterial hypoxemia ( $\text{P}_{\text{a}}\text{O}_2/\text{F}_{\text{O}_2} <300$ )
Heart rate $>90/\text{min}$	Acute oliguria (urine output $<0.5\text{ mL/kg/h}$ )
sBP $<90\text{ mmHg}$ , MAP $<70$ , or a sBP decrease $>40\text{ mmHg}$	Creatinine increase $>0.5\text{ mg/dL}$
Tachypnea	Coagulation abnormalities (INR $>1.5$ or aPTT $>60\text{ s}$ )
Altered mental status	Ileus (absent bowel sounds)
Positive fluid balance ( $>20\text{ mL/kg}$ over 24 h)	Thrombocytopenia (platelet count $<100,000/\text{L}$ )
Hyperglycemia (BG $>7.7\text{ mmol/L}$ ) in the absence of diabetes	Hyperbilirubinemia (plasma total bilirubin $>4\text{ mg/dL}$ or $70\text{ mmol/L}$ )
Leukopenia (WBC $<4,000/\text{L}$ )	Leukocytosis (WBC $>12,000/\text{L}$ )
Normal WBC count with $>10\%$ immature forms	
Plasma C-reactive protein $>2\text{ SD}$ above the normal value	
	<b>Tissue Perfusion Variables</b>
	Hyperlactatemia ( $>1\text{ mmol/L}$ )
	Decreased capillary refill or mottling

Table adapted with permission from Levy MM, Fink MP, Marshall JC, Abraham E, Angus D, Cook D, Cohen J, Opal SM, Vincent J-L, Ramsay G. 2001 SCCM/ESICM/ACCP/ATS/SIS International Sepsis Definitions Conference. Critical Care Medicine 2003;31:1250-1256

### Treatment

- identify the cause and source of infection: blood, sputum, urine Gram stain and C&S
- initiate empiric antibiotic therapy
- monitor, restore and maintain hemodynamic function

### Early Goal Directed Therapy

- adjustments of cardiac preload, afterload and contractility to balance oxygen delivery with demand
- should be started immediately and completed within 6 h of recognition of severe sepsis or septic shock

### Systemic Inflammatory Response Syndrome (SIRS):

generalized inflammatory reaction caused by infectious and noninfectious entities, manifested by two or more of:

- Body temperature  $>38.5^{\circ}\text{C}$  or  $<35^{\circ}\text{C}$
- Heart rate  $>90/\text{min}$
- Respiratory rate  $>20/\text{min}$  or  $\text{P}_{\text{a}}\text{CO}_2 <32\text{ mmHg}$
- WBC  $>12,000\text{ cells/mL}$  or  $<4,000\text{ cells/mL}$  or  $>10\%$  bands

### Corticosteroids for Treating Severe Sepsis and Septic Shock

*Cochrane DB Syst Rev* 2010;CD002243

**Study:** Meta-analysis of 25 RCTs and quasi-RCTs examining the efficacy of corticosteroids on death at one month in patients with severe sepsis and septic shock.

**Results:** Overall, there was no difference in 28-d all-cause mortality but there was significant heterogeneity in dosing strategy between the studies. Treatment with long course of low dose corticosteroids significantly reduced 28-d mortality, increased the proportion of shock reversal by day 7 and day 28, reduced the sepsis-related organ failure assessment score by day 7, and survivors' length of stay in the ICU, without inducing gastrointestinal bleeding, superinfection, or neuromuscular weakness. Corticosteroids increased the risk of hyperglycemia and hypernatremia.

**Conclusions:** Corticosteroids did not change mortality in severe sepsis and septic shock. A long course of low dose corticosteroids reduced 28-d mortality without major complications.

- patient should meet SIRS criteria and sBP <90 mmHg or lactate >4 mmol/L
  1. supplemental oxygen ± intubation and mechanical ventilation
  2. central venous and arterial catheterization
  3. maintain CVP 8-12 mmHg with IV crystalloids/colloids
  4. MAP maintained 65-90 mmHg with the use of vasoactive agents
  5.  $S_{cv}O_2$  <70% then
    - ♦ transfusion of red cells until Hct >30%
    - ♦ if  $S_{cv}O_2$  <70% after transfusion then use inotropic agents
- supportive oxygenation and ventilation using lung-protective regimen
- early nutritional support: enteral route is used to preserve function of intestinal mucosal barrier
- control hyperglycemia with insulin to decrease infectious complications
- physiologic dose corticosteroid replacement therapy in patients with relative adrenal insufficiency (nonresponders to corticotropin stimulation test)
  - consider in mechanically ventilated septic shock patients with organ dysfunction requiring vasopressors, despite early goal-directed therapy and appropriate antibiotic therapy
- recombinant activated protein C may be considered in patients with severe sepsis or septic shock with an APACHE II score >25 despite early goal-directed therapy and appropriate antibiotic therapy
- DVT/PE prophylaxis
- advanced care planning, including the communication of likely outcomes and realistic goals of treatment with patients and families

#### Early Goal-Directed Therapy for Severe Sepsis and Septic Shock

NEJM 2001;345:1368-1377

**Purpose:** To evaluate the efficacy of early goal-directed therapy before ICU admission.

**Methods:** Randomized assignment of patients who presented to emergency with severe sepsis or septic shock to either 6 h of early goal-directed therapy or standard therapy (hemodynamic support protocol). Clinicians who assumed care subsequently were blinded to treatment assignment. Primary outcomes were mortality and APACHE II scores.

**Results:** The mortality rate in the early therapy group (n=130) and control group (n=133) was 30.5% and 46.5% respectively (p=0.009). Within the 72 h, early therapy resulted in a significantly higher mean central venous oxygen saturation (70.4% vs. 65.3%), a lower lactate concentration (3.0 vs. 3.9 mmol/L), and a higher pH (7.40 vs. 7.36) compared to standard therapy (P<0.02 for all comparisons). APACHE II scores were significantly lower in the early therapy group (13.0 vs. 15.9; P<0.001).

**Conclusion:** Severe sepsis and septic shock significantly benefit from early goal-directed therapy compared to standard therapy protocols.

## Common Medications

Table 36. Common Medications for Respiratory Diseases

	Drug	Typical Adult Dose	Indications	Side Effects
<b>β<sub>2</sub>-AGONISTS</b>				
<b>Short-acting</b>	salbutamol/albuterol (Ventolin®) (light blue/navy), terbutaline (Bricanyl®)	1-2 puffs q4-6h prn	Bronchodilator in acute reversible airway obstruction	CV (angina, flushing, palpitations, tachycardia, can precipitate Afib), CNS (dizziness, headache, insomnia, anxiety), GI (diarrhea, nausea, vomiting), rash, hypokalemia, paroxysmal bronchospasm
<b>Long-acting</b>	salmeterol (Serevent®), formoterol (Oxeze®) indacaterol (Onbrez®)	1-2 puffs bid 1 puff daily	Maintenance treatment (prevention of bronchospasm) in COPD, asthma	
<b>Combination Long-acting β<sub>2</sub>-agonist and inhaled corticosteroid</b>	fluticasone and salmeterol (Advair®) (purple MDI or diskus) Budesonide and formoterol (Symbicort®) (red turbuhaler) Mometasone and formoterol (Zenhale®) (blue MDI)	1 puff bid 2 puffs bid	COPD and asthma	Common: CNS, headache, dizziness Resp: URTI, GI (N/V, diarrhea, pain/discomfort, oral candidiasis)
<b>ANTICHOLINERGICS</b>				
	ipratropium bromide (Atrovent®) (clear/green), tiotropium bromide (Spiriva®) glycopyrronium bromide	2-3 puffs qid 1 puff qam 1 puff daily	Bronchodilator used in COPD, bronchitis and emphysema	Palpitations, anxiety, dizziness, fatigue, headache, nausea, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs
<b>CORTICOSTEROIDS</b>				
<b>Inhaled</b>	fluticasone (Flovent®) (orange/peach) budesonide (Pulmicort®) ciclesonide (Alvesco®) beclomethasone (QVAR®, Vanceril®) Mometasone (Asmanex®)	2-4 puffs bid 2 puffs bid 1-4 puffs OD 1-4 puffs bid (40 µg), 1-2 puffs bid (80 µg) 1 puff daily or bid	Maintenance treatment of asthma	Headache, fever, N/V, MSK pain, URTI, throat irritation, growth velocity reduction in children/adolescents, HPA axis suppression, increased pneumonia risk in COPD
<b>Systemic</b>	prednisone (Apo-prednisone®, Deltasone®) methylprednisolone (Depo-Medrol®, Solu-Medrol®)	Typically 40-60 mg per day PO 125 mg q8h IV (sodium succinate) loading dose 2 mg/kg then 0.5-1 mg/kg q6h for 5 d	Acute exacerbation of COPD; severe, persistent asthma, PCP Status asthmaticus	Endocrine (hirsutism, DM/glucose intolerance, Cushing's syndrome, HPA axis suppression), GI (increased appetite, indigestion), ocular (cataracts, glaucoma), edema, AVN, osteoporosis, headache, psych (anxiety, insomnia), easy bruising
<b>ADJUNCT AGENTS</b>				
	theophylline (Uniphyll®)	400-600 mg OD	Treatment of symptoms of reversible airway obstruction due to COPD	GI upset, diarrhea, N/V, anxiety, headache, insomnia, muscle cramp, tremor, tachycardia, PVCs, arrhythmias, Toxicity: persistent, repetitive vomiting, seizures
<b>LEUKOTRIENE ANTAGONISTS</b>				
	montelukast (Singulair®) zafirlukast (Accolate®)	10 mg PO qhs, now only available as once daily slow release 20 mg bid	Prophylaxis and chronic treatment of asthma	Headache, dizziness, fatigue, fever, rash, dyspepsia, cough, flu-like symptoms
<b>MONOCLONAL ANTIBODIES</b>				
	omalizumab (Xolair®)	150-375 mg SC q2-4wk	Moderate-severe persistent asthma	Headache, sinusitis, pharyngitis, URTI, viral infection, thrombocytopenia, anaphylaxis

**Table 36. Common Medications for Respiratory Diseases** (continued)

Table 69: Common Medications for Respiratory Diseases (continued)				
	Drug	Typical Adult Dose	Indications	Side Effects
PDE5 INHIBITORS				
	Roflumilast (Daxas®)	500 µg PO OD	Severe emphysema, with frequent exacerbations	Weight loss, suicidal ideation
ANTIBIOTICS – COMMUNITY ACQUIRED PNEUMONIA				
Macrolide	erythromycin	250-500 mg PO tid x 7-10 d	Alternate to doxycycline or fluoroquinolone	GI (abdominal pain, diarrhea, N/V), headache, prolonged QT, ventricular arrhythmias, hepatic impairment GI (diarrhea, N/V, abdo pain), renal failure, deafness Headache, rash, GI (diarrhea, N/V, abnormal taste, heartburn, abdo pain), increased urea
	azithromycin	500 mg PO x 1 dose, then 250 mg OD x 4		
	clarithromycin	500 mg PO bid x 7-10 d		
Doxycycline		100 mg PO bid x 7-10 d	Alternate to macrolide or fluoroquinolone	Photosensitivity, rash, urticaria, anaphylaxis, diarrhea, enterocolitis, tooth discolouration in children
Fluoroquinolone	levofloxacin (Levaquin®)	500 mg PO OD x 7-10 d	Alternate to macrolide or doxycycline	CNS (dizziness, fever, H/A), GI (N/V, diarrhea, constipation), prolonged QT
	moxifloxacin (Avelox®)	400 mg PO OD x 7 d		
ANTIBIOTICS – HOSPITAL ACQUIRED PNEUMONIA				
3rd gen Cephalosporin	ceftriaxone (Rocephin®)	1-2 g IV OD x 7-10 d	Combine with fluoroquinolone or macrolide	Rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, elevated transaminases
Fluoroquinolone	levofloxacin	750 mg PO OD x 5 d	Combine with 3rd gen cephalosporin	See above
	moxifloxacin	400 mg PO OD x 7 d (5 d for AECOPD)		
Piperacillin/Tazobactam (Tazocin®)		4.5 g IV q6-8h x 7-10 d	Suspect Pseudomonas	CNS (confusion, convulsions, drowsiness), rash, Hematologic (abnormal platelet aggregation, prolonged PT, positive Coombs)
Vancomycin (Vancocin®)		1 g IV bid x 7-10 d	Suspect MRSA	CNS (chills, drug fever), hematologic (eosinophilia), rash, red man syndrome, interstitial nephritis, renal failure, ototoxicity
Macrolide	azithromycin	500 mg IV OD x 2 d, then 500 mg PO OD x 5 d	Suspect Legionella	See above See above
	clarithromycin	500 mg PO bid x 7-10 d		
ICU MEDICATIONS				
Pressors/Inotropes	norepinephrine (Levophed®)	0.5-30 µg/min IV	Acute hypotension	Angina, bradycardia, dyspnea, hyper/hypotension, arrhythmias
	phenylephrine	0.5 µg/kg/min IV	Severe hypotension	See above
	dobutamine	2-20 µg/kg/min IV	Inotropic support	See above
Sedatives/Analgesia	fentanyl (opioid class)	50-100 µg then 50-unlimited µg/h IV	Sedation and/or analgesia	Bradycardia, respiratory depression, drowsiness, hypotension
	propofol (anesthetic)	1-3 mg/kg then 0.3-5 mg/kg/h IV	Sedation and/or analgesia	Apnea, bradycardia, hypotension (good for ventilator sedation)

See [Infectious Diseases](#), ID23 – for the management of pulmonary tuberculosis

## Landmark Respiriology Trials

Trial	Reference	Results
ARDS Network	NEJM 2000; 342:1301-8	Mortality decreased in ARDS patients ventilated with a low tidal volume strategy
Berlin Criteria	JAMA 2012; 307:2526-33	The new definition of ARDS, better predicts mortality
CPAP and Apnea	NEJM 2005; 353:2025-33	CPAP ameliorates symptoms of sleep apnea but does not affect mortality in CHF
EINSTEIN-PE	NEJM 2012; 366:1287-97	Fixed dose of rivoxaban was non-inferior to standard therapy (Vit K antagonist) initial and long term treatment of PE
Emphysema Treatment Trial	NEJM 2003; 348:2059-73	Lung volume reduction surgery benefits patients with upper lobe disease and low exercise capacity
IELCAP	NEJM 2006; 355:1763-71	High survival rate in patients with early stage lung cancer detected by low dose CT screening
Lung Health	JAMA 1994; 272:1497-505	Aggressive smoking intervention significantly decreases the age-related decline in FEV <sub>1</sub> in middle-aged smokers with mild airways obstruction
Pneumonia	NEJM 1978; 298:801-9	Interstitial lung disease subsets have different prognoses and response to treatment (e.g. desquamative but not usual interstitial pneumonia respond well to corticosteroids)
POET-COPD	NEJM 2011; 364:1093-103	Tiotropium decreases the number of moderate-to-severe exacerbations in comparison to salmeterol
ROFLUMILAST	LANCET 2009; 374:695-703	Leukotriene inhibitors improve FEV <sub>1</sub> when used as add-on therapy in COPD patients on tiotropium or salmeterol
TORCH	NEJM 2007; 356:775-89	Combination of inhaled steroids and long-acting β <sub>2</sub> -agonists improves COPD symptoms, reduces exacerbations and shows a trend to lowers mortality
UPLIFT	NEJM 2008; 359:1543-54	Tiotropium improves symptoms of COPD with fewer exacerbations, but does not affect FEV <sub>1</sub> decline

## Acronyms

Ab	antibody	GC	<i>Neisseria gonorrhea</i> /gonococcus	PMR	polymyalgia rheumatica
Ag	antigen	GCA	giant cell arteritis	PsA	psoriatic arthritis
ANA	antinuclear antibody	H/A	headache	PTT	partial thromboplastin time
Anti-Sm	anti-Smith antibodies	HA	hyaluronic acid	RA	rheumatoid arthritis
APLA	antiphospholipid antibody syndrome	Hb	hemoglobin	RBC	red blood cell
AS	ankylosing spondylitis	HLA	human leukocyte antigen	ReA	reactive arthritis
BUN	blood urea nitrogen	IA	intra-articular	RF	rheumatoid factor
CBC	complete blood count	IBD	inflammatory bowel disease	ROM	range of motion
CCP	cyclic citrullinated peptide	IE	infective endocarditis	SLE	systemic lupus erythematosus
CNS	central nervous system	MCP	metacarpal phalangeal joint	SS	Sjögren's syndrome
CRP	C-reactive protein	MCTD	mixed connective tissue disease	ULN	upper limit of normal
DIP	distal interphalangeal joint	MHC	major histocompatibility complex	VDRL	venereal disease research laboratory
EA	enteropathic arthritis	OA	osteoarthritis	WBC	white blood cell
ESR	erythrocyte sedimentation rate	PIP	proximal interphalangeal joint		

## Anatomy of Joint Pathology

Figure 1. Structure of normal, degenerative and inflammatory joint

### Terminology in Rheumatology

#### Arthritis:

- Joint swelling: effusion/synovial thickening
- Decreased range of motion
- Stress pain
- Increased warmth

**Arthralgia:** perception of joint pain without obvious clinical findings

**Active joint:** swollen joint, joint line tenderness, or stress pain (pain at end of range of motion)

## Basics of Immunology

### Immune Mechanisms of Disease

Table 1. Mechanisms of Immunologically Mediated Disorders

Type	Pathophysiology	Examples
Anaphylactic (type I)	Formation of IgE → release of immunologic mediators from basophils/mast cells → diffuse inflammation	Asthma Allergic rhinitis
Cytotoxic (type II)	Formation of antibody (Ab) → deposit and bind to antigen (Ag) on cell surface → phagocytosis or lysis of target cell	Autoimmune hemolytic anemia, Goodpasture's syndrome, Graves' disease, pernicious anemia
Immune complex (type III)	formation of Ag-Ab complexes → activate complement → attract inflammatory cells and release of cytokines	SLE, PAN, post-streptococcal glomerulonephritis, serum sickness
Cell-mediated/delayed hypersensitivity (type IV)	Release of cytokines by sensitized T-cells and T-cell mediated cytotoxicity	Contact dermatitis

### Immunogenetics and Disease

- cell surface molecules called human leukocyte antigen (HLA) play a role in mediating immune reactions
- major histocompatibility complex (MHC) are genes on the short arm of chromosome 6 that encode HLA molecules
- there are three classes of MHC (see Table 2)
- discrete domains of hypervariability within MHC molecules thought to represent “susceptibility determinants”
- certain HLA haplotypes are associated with increased susceptibility to autoimmune diseases (see Table 3)

Table 2. Classes of Major Histocompatibility Complexes (MHCs)

MHC Class	Types	Location	Function
I	HLA-A, B, C	All cells	Recognized by CD8+ (cytotoxic) T-lymphocytes
II	HLA-DP, DQ, DR	Antigen presenting cells (mononuclear phagocytes, B cells, others)	Recognized by CD4+ (helper) T-lymphocytes
III	Some components of the complement cascade	In plasma	Chemotaxis, opsonization, lysis of bacteria and cells

Table 3. HLA-Associated Rheumatic Disease

HLA Type	Associated Conditions	Comments
<b>B27</b>	Ankylosing spondylitis (AS) Reactive arthritis (ReA) Enteropathic arthritis (EA)	In AS, relative risk = 70-90 times In ReA, relative risk = 40 times
<b>DR4, DR1</b>	Rheumatoid arthritis (RA)	In RA, relative risk = 2-10 times; found in 93% of patients
<b>DR3</b>	Sjögren's syndrome SLE	DR3 associated with many non-rheumatic conditions (celiac disease, Type 1 DM, Graves' disease, chronic active hepatitis)

## Differential Diagnoses of Common Presentations

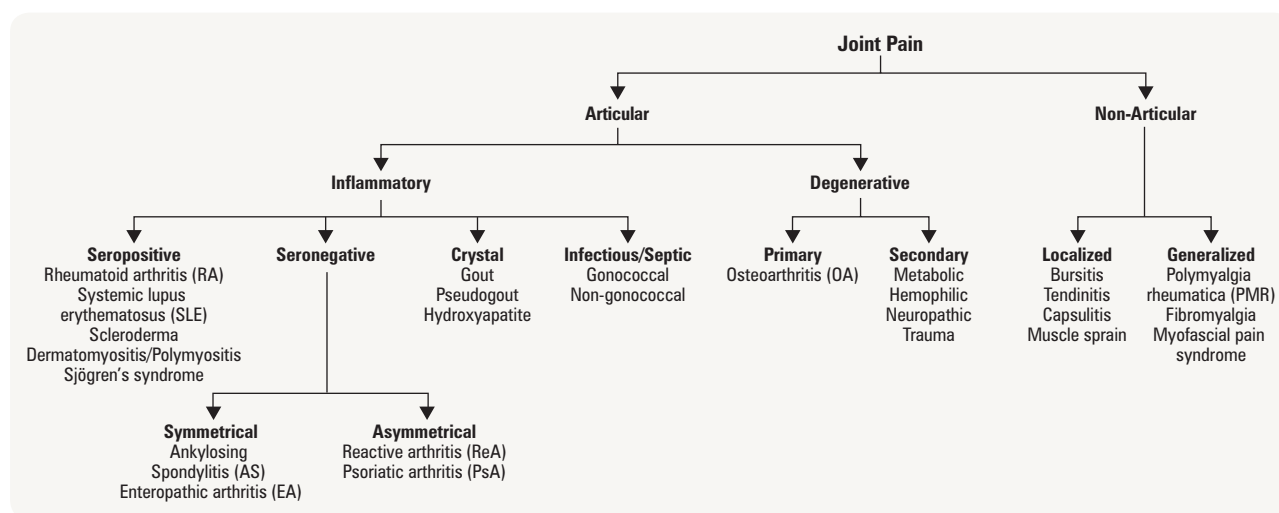

Figure 2. Clinical approach to joint pain

Table 4. Differential Diagnosis of Monoarthritis

Infection	Crystal	Degenerative	Trauma	Neoplastic	Other
Septic arthritis (staph, gonococcal, fungi, TB)	Gout Pseudogout Hydroxyapatite	Osteoarthritis	Hemarthrosis Osteonecrosis	Tumour	Systemic inflammatory disease Polyarthritis presenting with monoarticular symptoms first

Table 5. Differential Diagnosis of Oligoarthritis/Polyarthritis

Acute (<6 weeks)	Chronic (>6 weeks)		
First presentation of inflammatory arthritis Post-viral (parvovirus B19) Acute rheumatic fever Infectious (GC, non-GC)	<b>Seropositive inflammatory arthritis</b> Rheumatoid arthritis Systemic lupus erythematosus Scleroderma Polymyositis/dermatomyositis	<b>Seronegative inflammatory arthritis</b> Ankylosing spondylitis Enteropathic arthritis Psoriatic arthritis Reactive arthritis Crystal (polyarticular gout)	<b>Degenerative</b> Osteoarthritis

Table 6. Symptoms of Inflammatory Arthritis vs. Degenerative Arthritis

Inflammatory	Degenerative
Pain at rest, relieved by motion Morning stiffness >1 h Warmth, swelling, erythema Malalignment/deformity Extra-articular manifestations	Pain with motion, relieved by rest Morning stiffness <½ h Joint instability, buckling, locking Bony enlargement, malalignment/deformity

### Causes of Joint Pain

#### SOFTER TISSUE

Sepsis  
OA  
Fracture  
Tendon/muscle  
Epiphyseal  
Referred  
Tumour  
Ischemia  
Seropositive arthritides  
Seronegative arthritides  
Urate (gout)/other crystal  
Extra-articular rheumatism (PMR/fibromyalgia)

### Patterns of Joint Involvement

- Symmetrical vs. asymmetrical
- Small vs. large
- Mono vs. oligo (2-4 joints) vs. polyarticular (≥5 joints)
- Axial vs. peripheral

Table 7. Seropositive vs. Seronegative Rheumatic Diseases

	Seropositive	Seronegative
<b>Demographics</b>	F > M	M > F
<b>Peripheral Arthritis</b>	Symmetrical Small (PIP, MCP) and medium joints (wrist, knee, ankle, elbow) common DIP less involved	Usually asymmetrical Usually larger joints, lower extremities (psoriatic arthritis may be the exception) DIP in psoriatic arthritis Dactylitis ("sausage digit") Enthesitis
<b>Pelvic/Axial Disease</b>	No (except for C-spine)	Yes
<b>Enthesitis</b>	No	Yes
<b>Extra-Articular</b>	Nodules Vasculitis Sicca Raynaud's phenomenon	Iritis (= anterior uveitis) Oral ulcers GI Dermatologic features

### Common Investigations in Rheumatology

- general: CBC, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology: autoimmune Abs (ANA, anti-dsDNA, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RhF, and anti-CCP, etc.)
- synovial fluid analysis
- radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

## Synovial Fluid Analysis

- synovial fluid is an ultrafiltrate of plasma plus hyaluronic acid; it lubricates joint surfaces and nourishes articular cartilage

### Indications

- diagnostic: mandatory if septic arthritis suspected; advised if crystal arthritis or hemarthrosis suspected; advised if unexplained effusion in accessible joint
- therapeutic: drainage of blood, purulent or tense effusions; corticosteroid injection

### Contraindications

- absolute: open lesion or suspected infection of overlying skin or soft tissue
- relative: bleeding diathesis, thrombocytopenia, prosthetic joint

### Most Important Tests of Synovial Fluid (3 Cs)

- ensure synovial fluid is described in terms of colour, clarity, viscosity, and quantity
- 1. Cell count and differential
- 2. Culture and Gram stain (bacteria, mycobacteria, fungi)
- 3. Crystal examination (microscopy with polarized light)
  - gout (monosodium urate) → needle-shaped, negatively birefringent (bright yellow)
  - pseudogout (calcium pyrophosphate dihydrate) → rhomboid-shaped, positively birefringent (pale blue)

Protein, LDH, glucose less helpful.

Table 8. Synovial Fluid Analysis

Parameter	Normal	Non-Inflammatory	Inflammatory	Infectious	Hemorrhagic
<b>Colour</b>	Pale yellow	Pale yellow	Pale yellow	Yellow to white	Red/brown
<b>Clarity</b>	Clear	Clear	Opaque	Opaque	Sanguinous
<b>Viscosity</b>	High (due to hyaluronic acid)	High	Low	Low or paradoxically high if purulent	Variable
<b>WBC/mm<sup>3</sup></b>	<200	<2000	>2000	Higher cell counts (particularly >50,000) suggestive	Variable
<b>% PMN</b>	<25%	<25%	>25%	>75%	Variable
<b>Culture/ Gram stain</b>	–	–	–	Usually positive	–
<b>Examples</b>		Trauma Osteoarthritis Neuropathy Hypertrophic – arthropathy	Seropositives Seronegatives Crystal arthropathies	<i>S. aureus</i> Gram negative Gonococcal → difficult to culture	Trauma Hemophilia

## Septic Arthritis

- for any acute monoarticular arthritis, one must rule out septic etiology; consider empiric antibiotic treatment until septic arthritis is excluded by history, physical exam and synovial fluid analysis
- poor prognostic factors : older age, immunocompromised, delay in treatment, previously damaged joint, joint prosthesis
- see [Infectious Diseases](#) for *Gonococcal Arthritis*, ID15/[Orthopedics](#), OR10

Septic arthritis is a medical emergency!

## Degenerative Arthritis: Osteoarthritis (OA)

### Definition

- progressive deterioration of cartilage and bone due to failed repair of joint damage caused by stresses on the joint

### Classification (based on etiology)

- primary (idiopathic)
  - most common, unknown etiology
- secondary
  - post-traumatic or mechanical
  - post-inflammatory (e.g. RA) or post-infectious
  - heritable skeletal disorders (e.g. scoliosis)
  - endocrine disorders (e.g. acromegaly, hyperparathyroidism, hypothyroidism)
  - metabolic disorders (e.g. gout, pseudogout, hemochromatosis, Wilson's disease, ochronosis)
  - neuropathic (e.g. Charcot joints)
    - ♦ atypical joint trauma due to peripheral neuropathy (e.g. diabetes, syphilis)
  - avascular necrosis
  - other (e.g. congenital malformation)

### Pathophysiology

- deterioration of articular cartilage due to local biomechanical factors and release of proteolytic and collagenolytic enzymes
  - OA develops when cartilage catabolism > synthesis
  - loss of proteoglycans and water exposes underlying bone
- abnormal local bone metabolism further damages joint
- altered joint function and damage
- synovitis is secondary to cartilage damage; therefore, may see small effusions in OA

### Epidemiology

- most common arthropathy
- increased prevalence with increasing age (35% of 30 yr olds, 85% of 80 yr olds)

### Risk Factors

- genetic predisposition, advanced age, obesity (for knee OA), female, trauma

### Signs and Symptoms

- localized to affected joints (not a systemic disease)
- pain is often insidious, gradually progressive, with intermittent flares and remissions

Table 9. Signs and Symptoms of OA

Signs	Symptoms
Joint line tenderness; stress pain $\pm$ joint effusion	Joint pain with motion; relieved with rest
Bony enlargement at affected joints	Short duration of stiffness (<1/2 h) after immobility
Malalignment/deformity (angulation)	Joint instability/buckling
Limited ROM	Joint locking due to "joint mouse" (bone or cartilage fragment)
Crepitus on passive ROM	Loss of function or other internal derangements (e.g. meniscal tear)
Inflammation (mild if present)	
Periarticular muscle atrophy	

### Joint Involvement (see Figure 3)

- asymmetric
- hand (see Figure 4)
  - DIP (Heberden's nodes = osteophytes  $\rightarrow$  enlargement of joints)
  - PIP (Bouchard's nodes)
  - CMC (usually thumb squaring)
  - 1<sup>st</sup> MCP (other MCPs are usually spared)

- Hand (DIP, PIP, 1st CMC)
- Hip
- Knee
- 1st MTP
- L-spine (L4-L5, L5-S1)
- C-spine
- Uncommon: ankle, shoulder, elbow, MCP, rest of wrist

© Linda Colati

Figure 3. Common sites of involvement in OA

1. Thumb squaring
2. Heberden's nodes
3. Bouchard's nodes

© Tabby Lulham 2011

Figure 4. Hand findings in OA

OA of MCP joints can be seen in hemochromatosis or chondrocalcinosis.

- hip
  - usually presents as groin pain  $\pm$  dull or sharp pain in the trochanteric area, internal rotation and abduction are lost first
  - pain can radiate to the anterior thigh but generally does not go below the knee
- knee
  - initial narrowing of one compartment, medial > lateral; seen on standing x-rays, often patellar-femoral joint involved
- foot
  - common in first MTP and midfoot
- lumbar spine
  - very common, especially L4-L5, L5-S1
  - degeneration of intervertebral discs and facet joints
  - reactive bone growth can contribute to neurological impingement (e.g. sciatica, neurogenic claudication) or spondylolisthesis (forward or backward movement of one vertebra over another)
- cervical spine
  - commonly presents with neck pain and to scapula, especially in mid-lower cervical area (C5 and C6)

### Investigations

- blood work
  - normal CBC and ESR, CRP
  - negative RF and ANA
- radiology: 4 hallmark findings (see sidebar)
- synovial fluid: non-inflammatory (see Table 8)

### Treatment

- presently no treatment alters the natural history of OA
- **non-pharmacological therapy**
  - weight loss (minimum 5-10 lb loss) if overweight
  - physiotherapy: heat/cold, low impact exercise programs
  - occupational therapy: aids, splints, cane, walker, bracing
- **pharmacological therapy** (see Table 31)
  - oral: acetaminophen/NSAIDs, glucosamine  $\pm$  chondroitin (nutraceuticals not proven)
  - joint injections: corticosteroid, hyaluronic acid (questionable benefit)
  - topical: capsaicin, NSAIDs
- **surgical treatment**
  - joint debridement, osteotomy, total and/or partial joint replacement, fusion (see [Orthopedics](#), OR10)

**Hint:** Bouchard's is closer to the Body

### The Radiographic Hallmarks of OA

- Joint space narrowing
- Subchondral sclerosis
- Subchondral cysts
- Osteophytes

### Meta-analysis: Chondroitin for Osteoarthritis of the Knee and Hip

*Ann Intern Med* 2007;146:580-590

**Study:** Meta-analysis of 20 RCTs and quasi-RCTs (n=3846) examining the efficacy of chondroitin on OA.

**Results:** The analysis of this review was hampered by significant trial heterogeneity. Trials with poor methodology (small numbers, inadequate randomization concealment, no intention to treat analysis) showed larger effect sizes in favour of chondroitin. When the authors restricted analysis to 3 trials with large sample sizes and an ITT analysis, 40% of patients were included and an effect size of -0.03 (95% CI -0.13 to 0.07) was generated.

**Conclusion:** There is high quality evidence to suggest there is no difference between chondroitin and placebo. Chondroitin should be discouraged from routine use in clinical practice.

### Intraarticular Corticosteroid for Treatment of Osteoarthritis of the Knee

*Cochrane DB Syst Rev* 2009;CD005328

**Population:** Patients with osteoarthritis (OA) of the knee.

**Intervention:** Intraarticular (IA) corticosteroid injection.

**Results:** 28 RCTs and quasi-RCTs (n=1973). IA corticosteroids were more effective than placebo for pain reduction and global assessment at one wk post-injection. There was significant pain reduction at 2 and 3 wk, but no benefit for pain and function beyond 4 wk post-injection. There was no benefit for global function beyond 1 wk post-injection. There were higher rates of pain reduction at 4 wk post-injection for triamcinolone hexacetonide versus betamethasone. There was no difference between IA corticosteroids and joint lavage in outcomes or safety. Hyaluronic acid (HA) injections showed better response than IA corticosteroids between 5 and 13 wk post-injection.

**Conclusion:** IA corticosteroid injection is effective for the short-term treatment of OA of the knee with few side effects. HA therapy can provide more durable results.

### Glucosamine Therapy for Treating Osteoarthritis

*Cochrane DB Syst Rev* 2009;CD002946

**Study:** Meta-analysis of 25 RCTs (n=4963) examining the efficacy of glucosamine on OA.

**Results:** Collectively the 25 RCTs favoured glucosamine over placebo for total reduction in pain with 22% improvement as well as improvement in function using the Lequesne index. However, results were not uniformly positive. Only the glucosamine containing Rotta preparation was found to be significant. Rotta preparation also showed that glucosamine was able to slow radiological evidence of OA over a 3 yr period.

Glucosamine had an excellent safety profile.

**Conclusion:** Rotta preparation of glucosamine was superior to placebo in the treatment of pain and functional impairment resulting from OA.

## SEROPOSITIVE RHEUMATIC DISEASE

- seropositive arthropathies are characterized by the presence of a serologic marker such as a positive rheumatoid factor or ANA
- the vasculitides are not seropositive diseases – some may be ANCA positive

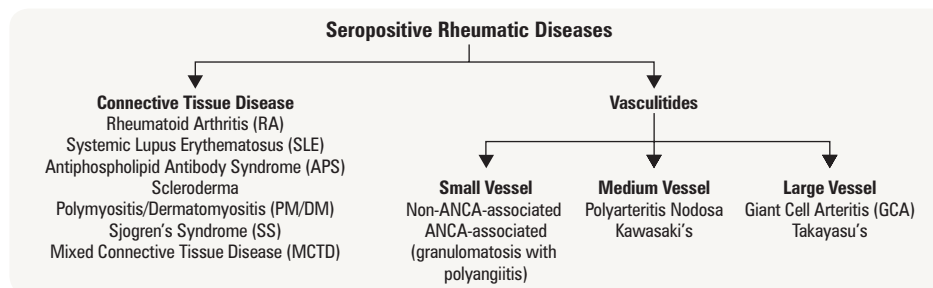

Figure 5. Seropositive rheumatic diseases

## Investigations

### Bloodwork

- general: CBC, creatinine
- acute phase reactants: ESR, CRP, ferritin, albumin, complement (C3 and C4), fibrinogen,
- Note: C3, C4 often decrease in active SLE
- autoantibodies (see Table 10)

### Urinalysis

- proteinuria, active sediment
- synovial fluid analysis (see Table 8)
- radiology (plain film, CT, MRI, ultrasound, bone densitometry, angiography, bone scan)

#### Differential Diagnosis of Elevated ESR

- RA, PMR, GCA
- Hypoalbuminemia, anemia, multiple myeloma
- Bacterial infections
- Malignancy

ESR (and CRP) is insensitive for PM/DM, AS, scleroderma, SLE, viral infections

**Table 10. Autoantibodies and their Prevalence in Rheumatic Diseases**

Autoantibody	Disease	Normal	Comments
<b>RF</b>	RA 80%	<5%	Autoantibodies (IgM>IgG>IgA) directed against Fc domain of IgG Present in most seropositive diseases Levels correlate with disease severity in RA Non-specific; may be present in IE, TB, hepatitis C, silicosis, sarcoidosis
	SS 50%	10-20%	
	SLE 20%	>65	
<b>Anti-CCP</b>	RA 80%		In RA: anti CCP more specific than RF May be useful in early disease and to predict aggressive disease
<b>ANA</b>	SLE 98%	<5% (seen in other CTDs)	Antibodies against nuclear components (DNA, RNA, histones, centromere) 1:40 dilution found in 5-30% of the normal population Sensitive but not specific for SLE
	MCTD 95%		
	SS 70-90%		
	CREST 80%		
<b>Anti-dsDNA</b>	SLE 50-70%	0%	Specific for SLE Levels correlate with disease activity
<b>Anti-Sm</b>	SLE <30%	0%	Specific but not sensitive for SLE
<b>Anti-Ro (SSA)</b>	SS 40-95%	0.5%	Subacute cutaneous SLE and mothers of babies with neonatal SLE 25%
<b>Anti-La (SSB)</b>	SS 40% SLE 10%	0%	Usually occurs with anti-Ro
<b>Antiphospholipid antibodies (LAC, ACLA)</b>	APS 100% SLE 31-40%	<5%	By definition present in APS Only small subset of SLE patients develop clinical syndrome of APS If positive will often get a false positive VDRL test
<b>Anti-histone</b>	Drug-induced SLE >90%	0%	
	Idiopathic SLE >50%	0%	
<b>Anti-RNP</b>	MCTD		Present in MCTD; present in many other CTD
<b>Anti-centromere</b>	CREST >80%	0%	Specific for CREST variant of systemic sclerosis
<b>Anti-topoisomerase I (formerly Scl-70)</b>	Diffuse systemic sclerosis 26-76%	0%	
<b>c-ANCA</b>	Active GPA (granulomatosis with polyangiitis) >90%	0%	Specific and sensitive
<b>p-ANCA</b>	GPA (granulomatosis with polyangiitis) 10% Other vasculitis	0%	Nonspecific and poor sensitivity (found in ulcerative colitis, polyarteritis nodosa, microscopic polyangiitis, Churg-Strauss, rapidly progressive glomerulonephritis)
<b>Anti-Mi-2</b>	DM 15-20%		Specific but not sensitive (not available in all centres)
<b>Antibodies against RBCs, WBCs, or platelets</b>	SLE		Perform direct Coomb's test Test hemoglobin, reticulocyte, leukocyte and platelet count, antiplatelet Abs

- note: some individuals in the normal population test positive for RF and/or ANA, but do not have the conditions listed

## Connective Tissue Disorders

**Table 11. Features of Seropositive Arthropathies**

	RA	SLE	Scleroderma	Dermatomyositis
<b>CLINICAL FEATURES</b>				
<b>History</b>	Symmetrical polyarthritis (small joint involvement) AM stiffness (>1 h)	Multisystemic disease: rash, photosensitivity, Raynaud's, alopecia, cardiac and pulmonary serositis, CNS symptoms, glomerulonephritis	Skin tightness, stiffness of fingers, Raynaud's, heartburn, dysphagia, pulmonary hypertension, renal dysfunction, dyspnea on exertion	Heliotrope rash (periocular), Gottron's papules (violaceous papules over knuckles and IP joints) ± poikiloderma Shawl sign macular erythema over chest and shoulder Proximal muscle weakness ± pain Dyspnea on exertion
<b>Physical Examination</b>	Effused joints Tenosynovitis Nodules Joint deformities Bone-on-bone crepitus	Confirm historical findings (rash, serositis, renal, CVS, etc.) ± effused (typically small) joints (can be minimal, look for soft tissue swelling)	Skin tightness on dorsum of hand, facial skin tightening, telangiectasia, calcinosis, non-effused joint, inspiratory crackles	Rash, proximal muscle weakness, inspiratory crackles
<b>LABORATORY</b>				
<b>Non-specific</b>	↑ ESR in 50-60% ↑ platelets ↓ Hb ↓ WBC (Felty's)	↑ ESR ↓ platelets (autoimmune) ↓ Hb (autoimmune) ↓ WBC (leukopenia, lymphopenia)	↑ ESR ↓ Hb Normal WBC	Possible increased ESR ↓ Hb Normal WBC
<b>Specific</b>	RF +ve in ~80% Anti-CCP +ve in ~80%	ANA +ve in 98% Anti-dsDNA +ve in 50-70% Anti-SM +ve in 30% ↓ C3, C4, total hemolytic complement False positive VDRL (in lupus subtypes) ↑ PTT (in lupus subtypes; e.g. anti-phospholipid Ab)	ANA +ve in >90% Anti-topoisomerase 1 (diffuse) Anti-centromere (usually in CREST, see RH13)	CK elevated in 80% ANA +ve in 33% anti-Jo-1, anti-Mi-2 Muscle biopsy EMG MRI
<b>Synovial Fluid</b>	Inflammation Leukocytosis (>10,000)	Mild inflammation with +ve ANA	Not specific	Not specific
<b>Radiographs</b>	Periarticular osteopenia Joint space narrowing Erosions Absence of bone repair Symmetric/concentric	Non-erosive ± osteopenia ± soft tissue swelling	± pulmonary fibrosis ± esophageal dysmotility ± calcinosis ± interstitial lung disease	± esophageal dysmotility ± interstitial lung disease ± calcifications

## Rheumatoid Arthritis (RA)

### Definition

- chronic, symmetric, erosive synovitis of peripheral joints (i.e. wrists, MCPs, MTPs)
- characterized by a number of extra-articular features

**Table 12. Classification Criteria for RA**

Criteria	Score	Comments
1. Joint involvement (swollen or tender)		
1 large joint (shoulders, elbows, hips, knees, and ankles)	0	
2-10 large joints	1	
1-3 small joints (MCPs, PIPs, wrists, 2nd-5th MTPs)	2	
4-10 small joints	3	
>10 joints (at least 1 small joint)	5	
2. Serology		Total score of ≥6: definite RA Must have at least ≥1 joint with definite clinical swelling, not better explained by other disease
Negative RF and negative Anti-CCP	0	
Low-positive RF or low-positive Anti-CCP (<3x ULN)	2	
High-positive RF or high-positive Anti-CCP (>3x ULN)	3	
3. Acute phase reactants		
Normal CRP and normal ESR	0	
Abnormal CRP and abnormal ESR	1	
4. Duration of symptoms		
<6 wk	0	
≥6 wk	1	

See sidebar for 1987 criteria. Reference: Arthritis Rheum 2010;62:2569-2581

RA is an independent risk factor for atherosclerosis and CV disease  
RA is associated with increased overall mortality/morbidity from all causes:  
CV disease, neoplasm (especially lymphoma), infection.

### Common Presentation

- Morning stiffness >1 h, improves with use
- Symmetric joint involvement
- Initially involves small joints of hands and feet
- Constitutional symptoms

### 1987 American Rheumatism Association RA criteria

At least 4 of:

- Morning stiffness >1 h for >6 wk
- Arthritis ≥3 joints for >6 wk
- Arthritis of hand joints for >6 wk
- Symmetric arthritis for >6 wk
- Rheumatoid nodules
- Serum RF positive
- Radiographic changes (erosions or periarticular osteopenia)

Criteria are 91-94% sensitive and 89% specific for RA.

### Pathophysiology

- autoimmune disorder, unknown etiology
- hallmark of RA is hypertrophy of the synovial membrane
  - activated rheumatoid synovium (pannus) grows into and over the articular surface; inflammatory mediators lead to release of metalloproteinases and collagenases resulting in destruction of articular cartilage and subchondral bone
- two theories attempt to explain chronic remissions and exacerbations seen in RA
  - **sequestered Ag**
    - ♦ during inflammation, immune complexes (ICs) are deposited at avascular cartilage-bone junction → ICs are released as further cartilage breaks down → triggers inflammatory cascade
  - **molecular mimicry**
    - ♦ cartilage damage → altered cartilage resembles undefined offending agent → triggers inflammatory cascade

### Epidemiology

- prevalence 1% of adult population
- F:M = 3:1
- age of onset 20-40 yr
- genetic predisposition: HLA-DR4/DR1 association (93% of patients have either HLA type)

### Signs and Symptoms

- variable course of exacerbations and remissions
- morning stiffness >1 h, improves with use, increases with rest
- may have joint pain with activity
- symmetric joint involvement (see Figure 6)
- joint swelling, tender joints
- signs of mechanical joint damage: loss of motion, instability, deformity, crepitus
- constitutional symptoms: profound fatigue; rarely myalgia or weight loss
- extra-articular features (EAF) (see Table 13)
- limitation of function and decrease in global functional status
- complications of chronic synovitis
  - signs of mechanical joint damage: loss of motion, instability, deformity, crepitus
  - joint deformities (see Figure 7)
    - ♦ swan neck deformity, boutonnière deformity
    - ♦ ulnar deviation of MCP, radial deviation of wrist joint
    - ♦ hammer toe, mallet toe, claw toe
    - ♦ flexion contractures
  - atlanto-axial and subaxial subluxation
    - ♦ C-spine instability
    - ♦ neurological impingement (long tract signs)
    - ♦ difficult/dangerous intubation: risk of worsening subluxation and damage to spinal cord
  - limited shoulder mobility, spontaneous tears of the rotator cuff leading to chronic spasm
  - tenosynovitis → may cause rupture of tendons
  - carpal tunnel syndrome
  - ruptured Baker's cyst (outpouching of synovium behind the knee); presentation similar to acute DVT

**Figure 6. Common sites of joint involvement in RA**

**Figure 7. Joint deformities**

**Table 13. Extra-Articular Features of RA Classified by Underlying Pathophysiology**

System	Vasculitic	Lymphocytic Infiltrate
<b>Skin</b>	Periungual infarction, cutaneous ulcers, palpable purpura	Rheumatoid nodules (may have vasculitic component)
<b>Ocular</b>	Episcleritis, scleritis	Keratoconjunctivitis sicca (see sidebar)
<b>Head and Neck</b>		Xerostomia (see sidebar), Hashimoto's thyroiditis (see <a href="#">Endocrinology, E27</a> )
<b>Cardiac</b>		Peri-/myocarditis, valvular disease, conduction defects
<b>Pulmonary</b>		Pulmonary fibrosis, pleural effusion, pleuritis, pulmonary nodules
<b>Neurologic</b>	Peripheral neuropathy: sensory stocking-glove, mononeuritis multiplex	
<b>Hematologic</b>		Splenomegaly, neutropenia (Felty's, see sidebar)
<b>Renal</b>		Amyloidosis – caused by accumulation of abnormal proteins

### Classification of Global Functional Status in RA (American College of Rheumatology, 1991)

- **Class I:** able to perform usual ADLs (self-care, vocational, avocational)
- **Class II:** able to perform self-care and vocational activities, restriction of avocational activities
- **Class III:** able to perform self-care, restriction of vocational and avocational activities
- **Class IV:** limited ability to perform self-care, vocational, avocational activities

#### Syndromes in RA

- Sjögren's syndrome (common): keratoconjunctivitis sicca and xerostomia (dry eyes and mouth)
- Caplan's syndrome (rare): multiple pulmonary nodules and pneumoconiosis
- Felty's syndrome (rare): arthritis, splenomegaly, neutropenia

## Investigations

- bloodwork
  - RF sensitivity ~80% but non-specific (see Table 10); may not be present at onset of symptoms
  - anti-CCP (cyclic citrullinated peptide): sensitivity ~80% but more specific; may precede onset of symptoms
  - increased disease activity is associated with decreased Hb (anemia of chronic disease), increased platelets, ESR, CRP, and RF
- imaging
  - x-rays may be entirely normal at onset
  - first change is periarticular osteopenia, followed by erosions
  - ultrasound, MRI may be used to image hands to detect early synovitis and erosions

## Treatment

- goals of therapy: remission or lowest possible disease activity
  - control disease activity
  - relieve pain and stiffness
  - maintain function and lifestyle
  - prevent or control joint damage
  - key is early diagnosis and early intervention with disease-modifying anti-rheumatic drugs (DMARDs)
  - “window of opportunity” = early treatment within first 3 mo of disease may allow better control/remission

## Education

- The Arthritis Society (Canada) and Arthritis Foundation (U.S.) for educational resources

## Behavioral

- exercise program (isometrics and active, gentle ROM exercise during flares, aquatic/aerobic/strengthening exercise between flares), assistive devices as needed
- job modification may be necessary

## Pharmacologic

### 1. Disease Modifying Anti-Rheumatic Drugs (DMARDs) and Biologics (see Table 32)

- **DMARDs:** standard of care and should be started as soon as possible
- treatments guided by disease severity and prognostic features
- methotrexate is the gold standard and is first-line unless contraindicated
- delayed onset of action (may take 8-12 wk)
- potential toxicities: GI, hematologic, hepatic (liver enzymes), pulmonary, teratogenic
- if inadequate response (3-6 mo) → combine or switch
- add-ons include: hydroxychloroquine, sulfasalazine, leflunomide
- **biologics:** indicated if inadequate response to DMARDs
  - ♦ can be combined with DMARD therapy
  - ♦ agents include abatacept, rituximab, tocilizumab
  - ♦ reassess every 3-6 mo and monitor disease severity

### 2. Reducing Inflammation and Pain

- NSAIDs
  - ♦ individualize according to efficacy and tolerability
  - ♦ contraindicated or cautioned in some patients (e.g. PUD, ischemic cardiac disease, pregnancy, see Table 31), add acetaminophen ± opioid prn for synergistic pain control
- corticosteroids
  - ♦ local
    - intra-articular injections to control symptoms in a specific joint
  - ♦ systemic (prednisone)
    - low dose (5-10 mg/d) useful for short term to improve symptoms if NSAIDs ineffective, to bridge gap until DMARD takes effect
    - do baseline DEXA bone density scan and consider bone supportive pharmacologic therapy if using corticosteroids >3 mo at >7.5 mg/d
    - cautions/contraindications: active infection, TB, osteoporosis, hypertension, gastric ulcer, diabetes

## Surgical Therapy

- indicated for structural joint damage
- surgical options include: synovectomy, joint replacement, joint fusion, reconstruction/tendon repair

Poor prognostic features of RA include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of EAF.

### Side Effects of Steroids

- Weight gain
- Osteoporosis
- Avascular necrosis (AVN)
- Cataracts, glaucoma
- Peptic ulcer disease (PUD)
- Susceptibility to infection
- Easy bruising
- Acne
- Hypertension
- Hyperlipidemia
- Hypokalemia, hyperglycemia
- Mood swings

Only DMARDs (not analgesics or NSAIDs) alter the course of RA!

### Comparison of Treatment Strategies in Early Rheumatoid Arthritis

*Ann Intern Med* 2007;146:406-415

**Study:** RCT of 508 patients comparing 4 different treatment strategies for early rheumatoid arthritis (known as the BEST trial).

#### Intervention:

- Group 1: Sequential Monotherapy with traditional DMARDs
- Group 2: Step-Up Combination Therapy
- Group 3: Initial Combination Therapy with prednisone (high dose)
- Group 4: Initial Combination Therapy with infliximab

**Results:** Patients in groups 3 and 4 responded faster and had significantly greater overall change in physical function scores after the first year of treatment. By end of the second yr, groups 1 and 2 had achieved a similar response to groups 3 and 4. Groups 3 and 4 also showed significantly less radiologic progression of their disease over 2 yr than groups 1 and 2. There were no significant differences in toxicity levels between the 4 groups.

**Conclusions:** Initial combination therapy with prednisone or infliximab results in faster response rates. Whether faster initial response rates leads to better long-term disease outcomes has not yet been studied.

## Systemic Lupus Erythematosus (SLE)

- please see [Nephrology](#), NP24 and [Dermatology](#), D39 for additional details

### Definition

- chronic inflammatory multi-system disease of unknown etiology
- characterized by production of autoantibodies and diverse clinical manifestations

**Table 14. Diagnostic Criteria of SLE: 4 or more of 11 must be present serially or simultaneously**

Criteria	Description
<b>CLINICAL</b>	
Malar rash	Classic "butterfly rash", sparing of nasolabial folds, no scarring
Discoid rash	May cause scarring due to invasion of basement membrane
Photosensitivity	Skin rash in reaction to sunlight
Oral/nasal ulcers	Usually painless
Arthritis	Symmetric, involving $\geq 2$ small or large peripheral joints, non-erosive
Serositis	Pleuritis or pericarditis
Neurologic disorder	Seizures or psychosis
<b>LABORATORY</b>	
Renal disorder	Proteinuria ( $>0.5$ g/d or 3+) <ul style="list-style-type: none"> <li>Cellular casts (RBC, Hb, granular, tubular, mixed)</li> </ul>
Hematologic disorder	Hemolytic anemia, leukopenia, lymphopenia, thrombocytopenia
Immunologic disorder	Anti-dsDNA or anti-Sm or antiphospholipid antibodies (anticardiolipin Ab, lupus anticoagulant) or false positive VDRL with 6 mo confirmation that it's negative
Antinuclear antibody (ANA)	Most sensitive test (98%), not specific

Note: "4, 7, 11" rule  $\rightarrow$  4 out of 11 criteria (4 lab, 7 clinical) for diagnosis  
American College of Rheumatology, 1997 update

### Etiology and Pathophysiology

- production of autoantibodies causing multi-organ inflammation
- multi-factorial etiology (see Figure 8)
- **genetics**
  - common association with HLA-B8/DR3;  $\sim 10\%$  have positive family history
- **estrogen**
  - pre-pubertal and post-menopausal women have similar incidence to men
  - men with SLE have higher concentration of estrogenic metabolites
- **infection**
  - viral (non-specific stimulant of immune response)
- **drug-induced**
  - anti-hypertensives (hydralazine), anti-convulsants (phenytoin), anti-arrhythmics (procainamide), isoniazid, biologics, oral contraceptive pills
  - anti-histone antibodies are commonly seen in drug-induced lupus
  - symptoms resolve with discontinuation of offending drug

### Epidemiology

- prevalence: 0.05% overall
- F:M = 10:1
- age of onset in reproductive yr (13-40)
- more common and severe in African-Americans and Asians
- bimodal mortality pattern
  - early (within 2 yr)
    - ♦ active SLE, active nephritis, infection secondary to steroid use
  - late ( $>10$  yr)
    - ♦ inactive SLE, inactive nephritis, atherosclerosis likely due to chronic inflammation

### Signs and Symptoms

- characterized by periods of exacerbation and remission

#### The Safety of Infliximab, Combined with Background Treatments, among Patients with Rheumatoid Arthritis and Various Comorbidities (START)

*Arthritis Rheum* 2006;54:1075-1086  
Study: Multicenter RCT.

**Patients:** 1084 patients (mean age 52 yr, 80% female) with active moderate to severe rheumatoid arthritis despite treatment with methotrexate.

**Intervention:** Patients were randomized to receive infusions of placebo, infliximab dosed at 3 mg/kg, or infliximab dosed at 10 mg/kg at 0, 2, 6, and 14 wk, in addition to methotrexate.

**Primary Outcome:** Incidence of serious infection within 22 wk.

**Results:** Compared with the placebo group, the relative risk of developing serious infection at 3 mg/kg and 10 mg/kg of infliximab was 1.0 (95% CI 0.3-3.1,  $p=0.995$ ) and 3.1 (95% CI 1.2-7.9,  $p=0.013$ ) respectively. In addition, 31% of patients receiving infliximab at 3 mg/kg and 32% of patients receiving infliximab at 10 mg/kg were able to achieve remission at 22 wk compared with only 14% of those receiving placebo ( $p<0.001$ , NNT=6).

**Conclusions:** Therapy with infliximab 3 mg/kg does not significantly increase the risk of serious infection in patients with active moderate to severe rheumatoid arthritis already receiving methotrexate. However, therapy with infliximab 10 mg/kg does significantly increase the risk of serious infection in this population.

#### Diagnostic Criteria of SLE

##### MD SOAP BRAIN

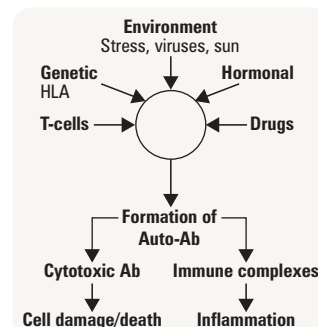

Malar rash	Blood
Discoid rash	Renal
Serositis	Arthritis
Oral ulcers	Immune
ANA	Neurologic
Photosensitivity	

Radiographically, the arthritis of SLE is non-erosive (unlike RA).

Consider SLE in a patient who has involvement of 2 or more organ systems.

**Figure 8. Multi-factorial etiology of SLE**

Table 15. Symptoms of SLE

System	Symptoms
<b>Systemic</b>	Fatigue, malaise, weight loss, fever, lymphadenopathy
<b>Renal</b>	Hypertension, peripheral edema, glomerulonephritis, renal failure
<b>Derm</b>	Photosensitivity, malar rash, discoid rash, oral ulcers, alopecia (hair loss), purpura, panniculitis (inflammation of subcutaneous fat and muscle tissue), urticaria
<b>MSK</b>	Polyarthralgias, polyarthritis, myalgias, avascular necrosis. Reducible deformities of hand = Jaccoud's arthritis
<b>Ophthalmic</b>	Keratoconjunctivitis sicca, episcleritis, scleritis, cytooid bodies (cotton wool exudates on fundoscopy = infarction of nerve cell layer of retina)
<b>Cardiac</b>	Pericarditis, coronary artery disease, non-bacterial endocarditis (Libman-Sachs) Note: SLE is an independent risk factor for atherosclerosis and CV
<b>Vascular</b>	Raynaud's phenomenon, livedo reticularis (mottled discolouration of skin due to narrowing of blood vessels, characteristic lacy or net-like appearance), thrombosis, vasculitis
<b>Resp</b>	Pleuritis, interstitial lung disease, pulmonary hypertension, PE, alveolar hemorrhage
<b>GI</b>	Pancreatitis, lupus enteropathy, hepatitis, hepatomegaly
<b>Neurologic</b>	Headache, depression, psychosis, seizures, cerebritis, transverse myelitis, peripheral neuropathy, stroke

### Investigations

- blood work: ANA (sensitivity 98%, but poor specificity → used as a screening test, ANA titres are not useful to follow disease course)
- anti-dsDNA and anti-Sm are specific (95-99%)
- anti-dsDNA titer and serum complement (C3, C4) are useful to monitor treatment response in patients who are clinically and serologically concordant
  - anti-dsDNA increases and C3 and C4 decrease with disease activity
- anti-phospholipid antibodies (anti-cardiolipin Ab and lupus anticoagulant), may cause increased risk of clotting and increased aPTT

### Treatment

- **goals of therapy**
  - treat early and avoid long term steroid use, if unavoidable see [Endocrinology](#), E42 for osteoporosis management
  - if high doses of steroids necessary for long-term control, add steroid-sparing agents and taper when possible
  - treatment is tailored to organ system involved and severity of disease
  - all medications used to treat SLE require periodic monitoring for potential toxicity
- **dermatologic**
  - sunscreen, avoid UV light and estrogens
  - topical steroids, hydroxychloroquine
- **musculoskeletal**
  - NSAIDs ± gastroprotective agent for arthritis (also beneficial for pleuritis and pericarditis)
  - hydroxychloroquine improves long term control and prevents flares
  - bisphosphonates, calcium, vitamin D to combat osteoporosis
- **organ-threatening disease**
  - high-dose oral prednisone or IV methylprednisolone in severe disease
  - steroid-sparing agents: azathioprine, methotrexate, mycophenolate
  - IV cyclophosphamide for serious organ involvement (e.g. cerebritis or SLE nephritis)

#### Drug-Induced SLE

Often presents atypically with systemic features and serositis; usually associated with anti-histone antibodies.

#### Raynaud's Phenomenon

Vasospastic disorder characteristically causing discolouration of fingers and toes (white → blue → red). Classic triggers: cold and emotional stress.

## Antiphospholipid Antibody Syndrome (APLA)

### Definition

- multi-system vasculopathy manifested by recurrent thromboembolic events, spontaneous abortions and thrombocytopenia
- often presents with migraine-type headaches
- circulating anti-phospholipid autoantibodies interfere with coagulation cascade
- **primary APLA**: occurs in the absence of other disease
- **secondary APLA**: occurs in the setting of a connective tissue disease (including SLE), malignancy, drugs (hydralazine, procainamide, phenytoin, interferon, quinidine), and infections (HIV, TB, hepatitis C, infectious mononucleosis)
- **catastrophic APLA**: development within 1 wk of small vessel thrombotic occlusion in ≥3 organ systems with positive anti-phospholipid antibodies (high mortality)

#### Manifestations of APLA

- Thromboembolic events
- Spontaneous abortions
- Thrombocytopenia
- Associated with livedo reticularis, migraine headaches

Arterial and venous thrombosis are usually mutually exclusive.

**Table 16. Classification Criteria of APLA: 1 clinical and 1 laboratory criteria must be present**

Criteria	Description
<b>CLINICAL</b>	
Vascular thrombosis	Arterial: stroke/TIA, multi-infarct dementia, MI, valvular incompetence, limb ischemia Venous: DVT, PE, renal and retinal vein thrombosis Must be confirmed by imaging or histopathology
Pregnancy morbidity	Fetal death (>10 wk GA), recurrent spontaneous abortions (<10 wk GA) or premature birth (<34 wk GA)
<b>LABORATORY</b>	
Lupus anticoagulant	Labs must be positive on 2 occasions, at least 12 wk apart
Anti-cardiolipin Ab	IgG and/or IgM
Anti- $\beta_2$ glycoprotein-I Ab	IgG and/or IgM

J Thromb Haemost 2006;4:295-306

**Signs and Symptoms**

- see clinical criteria in Table 16
- hematologic
  - thrombocytopenia, hemolytic anemia, neutropenia
- dermatologic
  - livedo reticularis, Raynaud's phenomenon, purpura, leg ulcers, and gangrene

**Treatment**

- thrombosis
  - lifelong anti-coagulation with warfarin
  - target INR 2.0-3.0 for first venous event, >3.0 for recurrent and/or arterial event
- recurrent fetal loss
  - heparin/low molecular weight heparin  $\pm$  Aspirin<sup>®</sup> during pregnancy
- catastrophic APS
  - high-dose steroids, anti-coagulation, cyclophosphamide, plasmapheresis

**A Systematic Review of Secondary Thromboprophylaxis in Patients with Anti-phospholipid Antibodies**

Arthritis Rheum 2007;57:1487-1495

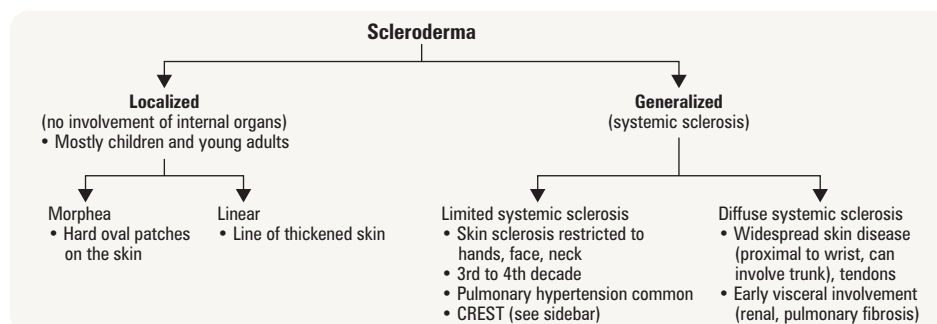

**Study:** Review of RCTs, prospective and retrospective cohort studies, and subgroup analysis (n >15) that focused on the secondary thromboprophylaxis in patients with anti-phospholipid antibodies (aPL) were selected.

**Results:** Sixteen studies were selected. Patients with venous events and a single test for aPL showed a low recurrence rate while receiving oral anti-coagulation at a target INR of 2.0-3.0. Patients with stroke and a single positive aPL test had no increased risk compared with those without aPL. Recurrence rates in patients with definite anti-phospholipid syndrome (APLA) and previous venous thromboembolism were lower than in patients with arterial and/or recurrent events, both with and without therapy. Only 3.8% of recurrent events occurred at an actual INR >3.0. Mortality due to recurrent thrombosis was higher than mortality due to bleeding (18 patients versus 1 patient reported).

**Conclusion:** For patients with definite APLA, the authors recommend prolonged warfarin therapy at a target INR of 2.0-3.0 in APLA patients with first venous events and >3.0 for those with recurrent and/or arterial events. For patients with venous thromboembolism or stroke and a single positive aPL test, the authors recommend further testing to determine if they have a persisting antibody. If they do not, the same therapy as for the general population should be used (warfarin at a target INR of 2.0-3.0 and low-dose Aspirin<sup>®</sup>, respectively).

**Scleroderma****Definition**

- a non-inflammatory autoimmune disorder characterized by widespread small vessel vasculopathy and fibrosis

**Figure 9. Forms of scleroderma****CREST Syndrome**

Calcinosis: calcium deposits on skin

Raynaud's phenomenon

Esophageal dysfunction: acid reflux

Sclerodactyly: tightening of skin on digits

Telangiectasia: superficial dilated blood vessels

**Table 17. Classification Criteria of Systemic Sclerosis: 1 major or 2 minor criteria must be present**

Criteria	Description
<b>Major</b>	
Scleroderma proximal to MCPs	Skin tightness, thickening, non-pitting induration
<b>Minor</b>	
Sclerodactyly	Skin changes limited to digits
Digital pitting scars or loss of substance from finger pad	
Bibasilar pulmonary fibrosis	

American Rheumatism Association, 1980

**Etiology and Pathophysiology**

- idiopathic vasculopathy (not vasculitis) leading to atrophy and fibrosis of tissues
  - intimal proliferation and media mucinous degeneration  $\rightarrow$  progressive obliteration of vessel lumen  $\rightarrow$  fibrotic tissue
  - resembles malignant hypertension

## Epidemiology

- F:M = 3-4:1, peaking in 5th and 6th decades
- associated with HLA-DR1
- associated with environmental exposure (silica, epoxy resins, toxic oil, aromatic hydrocarbons, polyvinyl chloride)
- limited systemic sclerosis has a higher survival prognosis (>70% at 10 yr) than diffuse systemic sclerosis (40-60% at 10 yr)

## Signs and Symptoms

**Table 18. Clinical Manifestations of Scleroderma**

System	Features
<b>Dermatologic</b>	Painless non-pitting edema → skin tightening Ulcerations, calcinosis, periungual erythema, hypo/hyperpigmentation, pruritus, telangiectasias Characteristic face: mask-like facies with tight lips, beak nose, radial perioral furrows
<b>Vascular</b>	Raynaud's phenomenon → digital pits, gangrene
<b>Gastrointestinal (~90%)</b>	Distal esophageal hypomotility → dysphagia Loss of lower esophageal sphincter function → GERD, ulcerations, strictures Small bowel hypomotility → bacterial overgrowth, diarrhea, bloating, cramps, malabsorption, weight loss Large bowel hypomotility → wide mouth diverticuli are pathognomonic radiographic finding on barium study
<b>Renal</b>	Mild proteinuria, creatinine elevation, hypertension "Scleroderma renal crisis" (10-15%) may lead to malignant arterial hypertension, oliguria and microangiopathic hemolytic anemia
<b>Pulmonary</b>	Interstitial fibrosis, pulmonary HTN, pleurisy, pleural effusions
<b>Cardiac</b>	Left ventricular dysfunction, pericarditis, pericardial effusion, arrhythmias
<b>Musculoskeletal</b>	Polyarthralgias "Resorption of distal tufts" (radiological finding) Proximal weakness 2° to disuse, atrophy, low grade myopathy
<b>Endocrine</b>	Hypothyroidism

## Investigations

- bloodwork
  - CBC, Cr, ANA
  - anti-topoisomerase 1/anti-Scl-70: specific but not sensitive for diffuse systemic sclerosis
  - anti-centromere: favours diagnosis of CREST (limited systemic sclerosis)
- PFT
  - assess for pulmonary hypertension or interstitial lung disease
- imaging
  - CXR for fibrosis, echo for pulmonary HTN

## Treatment

- dermatologic
  - good skin hygiene
  - low-dose prednisone (>20 mg may provoke renal crisis if susceptible), methotrexate (limited evidence)
- vascular
  - patient education on cold avoidance
  - vasodilators (CCBs, local nitroglycerine cream, systemic PGE<sub>2</sub> inhibitors, PDE5 inhibitors)
- gastrointestinal
  - GERD: PPIs are first line, then H<sub>2</sub>-receptor agonists
  - small bowel bacterial overgrowth: broad spectrum antibiotics (tetracycline, metronidazole)
- renal disease
  - ACE inhibitors for hypertensive crisis
- pulmonary
  - early interstitial disease: cyclophosphamide
  - pulmonary hypertension: vasodilators e.g. bosentan (Tracleer®), epoprostenol (Flolan®), PDE5 inhibitors
- cardiac
  - pericarditis: systemic steroids
- musculoskeletal
  - arthritis: NSAIDs
  - myositis: systemic steroids

### Raynaud's Phenomenon DDX

#### COLD HAND

Cryoglobulins/Cryofibrinogens  
Obstruction/Occupational  
Lupus erythematosus, other connective tissue disease  
Diabetes mellitus/Drugs  
Hematologic problems (polycythemia, leukemia, etc.)  
Arterial problems (atherosclerosis)/  
Anorexia nervosa  
Neurologic problems (vascular tone)  
Disease of unknown origin (idiopathic)

Scleroderma is the most common cause of secondary Raynaud's phenomenon.

Lung disease is the most common cause of morbidity and mortality.

### Features of Pathologic Raynaud's Syndrome

- New onset
- Asymmetric
- Precipitated by stimuli other than cold
- Associated with distal pulp pitting or tissue reabsorption
- Digit ischemia
- Capillary dilatation by capillaroscopy

## Idiopathic Inflammatory Myopathy

### Definition

- autoimmune diseases characterized by proximal muscle weakness  $\pm$  pain
- muscle becomes damaged by a non-suppurative lymphocytic inflammatory process
- classification
  - polymyositis (PM)/dermatomyositis (DM) (see Table 19)
    - adult and juvenile form
    - associated with malignancy
      - ♦ increased risk of malignancy: age >50, DM>PM, normal CK, refractory disease
      - ♦ 2.4-6.5 fold increased risk of underlying malignancy usually in internal organs
  - associated with other connective tissue disease
  - inclusion body myositis (IBM)
    - ♦ age >50, M>F, slowly progressive, vacuoles in cells on biopsy
    - ♦ suspect when patient unresponsive to treatment
    - ♦ distal as well as proximal muscle weakness
    - ♦ muscle biopsy positive for inclusion bodies

### POLYMYOSITIS (PM)/DERMATOMYOSITIS (DM)

**Table 19. Classification Criteria for PM/DM. Definite if 4 present, probable if 3 present.**

Criteria	Description
1. Symmetric proximal muscle weakness	Typical involvement of shoulder girdle and hip girdle
2. Elevated muscle enzymes	$\uparrow$ CK, aldolase, LDH, AST, ALT
3. EMG changes	Short polyphasic motor units, high frequency repetitive discharge, insertional irritability
4. Muscle biopsy	Segmental fibre necrosis, basophilic regeneration, perivascular inflammation (DM), endomysial inflammation (PM) and atrophy
5. Typical rash of dermatomyositis	Required for diagnosis of DM (see below)

NEJM 1975;292:403-407

### Etiology and Pathophysiology

- PM is CD8 cell-mediated muscle necrosis, found in adults
- DM is B-cell and CD4 immune complex-mediated peri-fascicular vascular abnormalities

### Signs and Symptoms

- progressive symmetrical proximal muscle weakness (shoulder and hip) developing over weeks to months
  - difficulty lifting head off pillow, arising from chair, climbing stairs
- dermatological
  - DM has characteristic dermatological features (F>M, children and adults)
    - ♦ Gottron's papules
      - pink-violaceous, flat-topped papules overlying the dorsal surface of the interphalangeal joints
    - ♦ Gottron's sign
      - erythematous, smooth or scaly patches over the dorsal IPs, MCPs, elbows, knees, or medial malleoli
    - ♦ heliotrope rash: violaceous rash over the eyelids; usually with edema
    - ♦ shawl sign: erythematous rash over neck, upper chest, and shoulders
    - ♦ mechanic's hands: dark, dry, thick scale on palmar and lateral surface of digits
    - ♦ periungual erythema
- cardiac
  - dysrhythmias, CHF, conduction defect, ventricular hypertrophy, pericarditis
- gastrointestinal
  - oropharyngeal and lower esophageal dysphagia, reflux
- pulmonary
  - weakness of respiratory muscles, interstitial lung disease, aspiration pneumonia

#### Signs of DM

Gottron's papules and Gottron's sign are pathognomonic of DM (occur in 70% of patients).

### Investigations

- bloodwork: CK, ANA, anti-Jo-1 (DM), anti-Mi-2, anti-SRP
- imaging: MRI may be used to localize biopsy site
- EMG, muscle biopsy

### Treatment

- non-pharm: physical therapy and occupational therapy
- pharmacologic treatment:
  - high-dose corticosteroid (1-2 mg/kg/d) and slow taper
  - add immunosuppressive agents (azathioprine, methotrexate, cyclosporine)
  - intravenous immunoglobulin if severe or refractory
  - hydroxychloroquine for DM rash

- malignancy surveillance
  - detailed history and physical (breast, pelvic and rectal exam)
  - CXR, abdominal and pelvic ultrasound, fecal occult blood, Pap test, mammogram ± CT scan (thoracic, abdominal, pelvic)

**Malignancies Associated with DM**

- Breast
- Lung
- Colon
- Ovarian

## Sjögren's Syndrome (SS)

### Definition

- autoimmune condition characterized by dry eyes (keratoconjunctivitis sicca/xerophthalmia) and dry mouth (xerostomia), caused by lymphocytic infiltration of salivary and lacrimal glands
- may evolve into systemic disorder with diminished exocrine gland activity in respiratory tract and skin
- primary and secondary form (associated with RA, SLE, DM and HIV)
- incidence estimated at 4/100,000 people
- 90% of cases are among females
- mean age of diagnosis is 40-60 yr

**Table 20. Classification Criteria for SS. Need 4 present, one of which includes salivary gland biopsy or autoantibodies**

Criteria	Description
1. Dry eye symptoms	Dry >3 mo, foreign body sensation, or requiring tear substitutes
2. Dry mouth symptoms	Dry >3 mo, swollen salivary glands, or requiring liquids to swallow food
3. Dry eye signs	Schirmer test (to assess tear flow) or slit lamp exam with Rose Bengal stain
4. Dry mouth signs	Low salivary flow, sialography
5. Salivary gland biopsy	Focal lymphocytic sialoadenitis
6. Autoantibodies	anti-Ro and/or anti-La, ANA, RF

Ann Rheum Dis 2002;61:554-558

### Signs and Symptoms

- "sicca complex": dry eyes (keratoconjunctivitis sicca/xerophthalmia), dry mouth (xerostomia)
- staphylococcus blepharitis
- dental caries, oral candidiasis, angular cheilitis (inflammation and fissuring at the labial commissures of the mouth)
- systemic complications
  - sinusitis, autoimmune thyroid dysfunction
  - arthralgias, arthritis
  - subclinical diffuse interstitial lung disease, xerotrachea leading to chronic dry cough
  - renal disease, glomerulonephritis
  - palpable purpura, vasculitis
  - peripheral neuropathy
  - lymphoma risk greatly increased

### Treatment

- ocular
  - artificial tears or surgical punctal occlusion for dry eyes
- oral
  - good dental hygiene, hydration
  - agents that stimulate salivary flow (e.g. pilocarpine)
  - topical nystatin or clotrimazole x 4-6 wk for oral candidiasis
- systemic
  - e.g. hydroxychloroquine, corticosteroids

**Classic Triad (identifies 93% of Sjögren's patients)**

- Dry eyes
- Dry mouth (xerostomia) → dysphagia
- Arthritis (small joint, asymmetrical, non-erosive) but may be associated with rheumatoid arthritis, in which case, the arthritis is erosive

Patients with Sjögren's syndrome are at higher risk of non-Hodgkin's lymphoma.

## Mixed Connective Tissue Disease (MCTD)/Overlap Syndrome

- syndrome with features of 3 different CTD (e.g. SLE, scleroderma, PM)
- common symptoms: Raynaud's phenomenon, swollen fingers
- bloodwork: anti-RNP (see Table 10)
- treatment is generally guided by the severity of symptoms and organ system involvement
- prognosis
  - 50-60% will evolve into SLE
  - 40% will evolve into scleroderma
  - only 10% will remain as MCTD for the rest of their lives
  - cardiac involvement (dysrhythmia) common, renal or lung involvement rare

# Vasculitides

- inflammation and subsequent necrosis of blood vessels leading to tissue ischemia or infarction
- any organ system can be involved
- keys to diagnosis
  - clinical suspicion: suspect in cases of unexplained multiple organ ischemia or systemic illness with no evidence of malignancy or infection
  - labs non-specific: anemia, increased WBC and ESR, abnormal urinalysis
  - biopsy if tissue accessible
  - angiography if tissue inaccessible
- treatment generally involves corticosteroids and/or immunosuppressive agents

**Table 21. Classification of Vasculitis and Characteristic Features**

Classification	Characteristic Features
<b>SMALL VESSEL</b>	
<ul style="list-style-type: none"> <li>• <b>Non-ANCA-associated</b> <ul style="list-style-type: none"> <li>Predominantly cutaneous vasculitis</li> <li>Henoch-Schönlein purpura (see <a href="#">Pediatrics</a>, P99)</li> <li>Essential cryoglobulinemic vasculitis</li> </ul> </li> </ul>	<p>Immune complex-mediated (most common mechanism)</p> <p>Also known as hypersensitivity/leukocytoclastic vasculitis</p> <p>Vascular deposition of IgA causing systemic vasculitis (skin, GI, renal), usually self-limiting; most common in childhood</p> <p>Systemic vasculitis caused by circulating cryoproteins forming immune complexes. May be associated with underlying infection (e.g. hepatitis C) or connective tissue disease.</p>
<ul style="list-style-type: none"> <li>• <b>ANCA-associated</b> <ul style="list-style-type: none"> <li>Granulomatosis with polyangiitis (GPA, formerly Wegener's)</li> <li>pR3 (c-ANCA) &gt; MPO (p-ANCA)</li> <li>Eosinophilic granulomatosis with polyangiitis (EPGA or Churg-Strauss syndrome) (50% ANCA positive)</li> <li>Microangiopathic polyangiitis (70% ANCA positive, usually MPO)</li> </ul> </li> </ul>	<p>Granulomatous inflammation of vessels of respiratory tract and kidneys, initially have URTI symptoms; most common in middle age</p> <p>Granulomatous inflammation of vessels with hypereosinophilia and eosinophilic tissue infiltration, frequent lung involvement (asthma, allergic rhinitis), can be associated with MPO or pR3, other manifestations include coronary arteritis, myocarditis and neuropathy, average age 40s</p> <p>Pauci-immune necrotizing vasculitis, affecting kidneys (necrotizing glomerulonephritis), lungs (capillaritis and alveolar hemorrhage), skin, most common in middle age</p>
<b>MEDIUM VESSEL</b>	
<ul style="list-style-type: none"> <li>Polyarteritis nodosa</li> <li>Kawasaki's (see <a href="#">Pediatrics</a>, P100)</li> </ul>	<p>Segmental, non-granulomatous necrotizing inflammation</p> <p>Unknown etiology in most cases, any age (average 40-50s), M&gt;F</p> <p>T lymphocyte response and granuloma formation</p>
<b>LARGE VESSEL</b>	
<ul style="list-style-type: none"> <li>Giant cell arteritis (GCA) /Temporal Arteritis</li> <li>Takayasu's arteritis</li> </ul>	<p>Inflammation predominantly of the aorta and arteries originating from it</p> <p>Over 50 yr of age, F&gt;M</p> <p>"Pulseless disease", unequal peripheral pulses, chronic inflammation, most often the aorta and its branches</p> <p>Usually young adults of Asian descent, F&gt;M; risk of aortic aneurysm</p>
<b>OTHER VASCULITIDES</b>	
<ul style="list-style-type: none"> <li>Buerger's disease ("Thromboangiitis Obliterans")</li> <li>Behçet's disease</li> <li>Vasculitis mimicry</li> </ul>	<p>Inflammation secondary to pathological clotting, affects small and medium-sized vessels of distal extremities, may lead to distal claudication and gangrene, most important etiologic factor is cigarette smoking</p> <p>Most common in young Asian males</p> <p>Leukocytoclastic vasculitis, multi-system disorder presenting with ocular involvement (uveitis), recurrent oral and genital ulceration, venous thrombosis, skin and joint involvement, more common in Mediterranean and Asia, average age 30s, M&gt;F</p> <p>Cholesterol emboli, atrial myxoma</p>

**c-ANCA:** circulating anti-neutrophil cytoplasmic antibody associated with anti PR3.

**p-ANCA:** perinuclear anti-neutrophil cytoplasmic antibody associated with multiple antigens, e.g. lactoferrin (IBD), myeloperoxidase (microscopic polyangiitis).

## Features of Small Vessel Vasculitis

- Palpable purpura
- Vesicles
- Chronic urticaria
- Superficial ulcers

## Churg-Strauss Triad

- Allergic rhinitis and asthma (often quiescent at time of vasculitis)
- Eosinophilic infiltrative disease resembling pneumonia
- Systemic vasculitis often mononeuritis multiplex/peripheral neuropathy and peripheral eosinophilia

## Features of Medium Vessel Vasculitis

- Livedo reticularis
- Erythema nodosum
- Raynaud's phenomenon
- Nodules
- Digital infarcts
- Ulcers

Figure 10. Classification of vasculitides by vessel size

Small Vessel Non-ANCA Associated Vasculitis

PREDOMINANTLY CUTANEOUS VASCULITIS

- subdivided into
  - drug-induced vasculitis
  - serum sickness reaction
  - vasculitis associated with other underlying primary diseases

Etiology and Pathophysiology

- cutaneous vasculitis following
  - drug exposure (allopurinol, gold, sulfonamides, penicillin, phenytoin)
  - viral or bacterial infection
  - idiopathic causes
- small vessels involved (post-capillary vessels most frequently)
- usually causes a leukocytoclastic vasculitis: debris from neutrophils around vessels
- sometimes due to cryoglobulins which precipitate in cold temperatures

Signs and Symptoms

- palpable purpura ± vesicles and ulceration, urticaria, macules, papules, bullae, subcutaneous nodules

Investigations

- vascular involvement (both arteriole and venule) established by skin biopsy

Treatment

- stop possible offending drug
- corticosteroids ± immunosuppressive agents
- usually self-limiting

Small Vessel ANCA-Associated Vasculitis

GRANULOMATOSIS WITH POLYANGIITIS (formerly known as Wegener’s Granulomatosis)

Definition

- granulomatous inflammation of vessels that may affect the upper airways (rhinitis, sinusitis), lungs (pulmonary nodules, infiltrates), and kidneys (glomerulonephritis, renal failure)
- highly associated with c-ANCA
- incidence 5 per 100,000; more common in Northern latitudes

Table 22. Classification Criteria for GPA. Diagnosed if 2 or more of the following 4 criteria present.

Criteria	Description
1. Nasal or oral involvement	Inflammation, ulcers, epistaxis
2. Abnormal findings on CXR	Nodules, cavitations, etc.
3. Urinary sediment	Protein, RBC casts
4. Biopsy of involved tissue	Lungs show granulomas, kidneys show necrotizing segmental glomerulonephritis

## Etiology

- pathology is complex, possibly involving transformation from inflammatory prodrome (serous otitis media and sinusitis) to full-blown vasculitic syndrome

## Signs and Symptoms

- systemic
  - malaise, fever, weakness, weight loss
- HEENT
  - sinusitis or rhinitis, nasal crusting and bloody nasal discharge, nasoseptal perforation, saddle nose deformity
  - proptosis due to: inflammation/vasculitis involving extra-ocular muscles, retrobulbar space occupying lesions or direct extension of masses from the upper respiratory tract
  - hearing loss due to involvement of CN VIII
- pulmonary
  - cough, hemoptysis
- renal
  - hematuria
- other
  - joint, skin, eye complaints, vasculitic neuropathy

## Investigations

- bloodwork: anemia (normal MCV), increased WBC, increased Cr, increased ESR, ANCA pR3 > MPO
- urinalysis: proteinuria, hematuria, RBC casts
- CXR: pneumonitis, lung nodules, infiltrations, cavitory lesions
- biopsy: renal (segmental necrotizing glomerulonephritis), lung (granulomas, tracheobronchial erosion)
- possible decline in c-ANCA and ESR used to monitor response to treatment in some patients

## Treatment

- prednisone 1 mg/kg/d PO for 3-6 mo  $\pm$  cyclophosphamide 2 mg/kg/d PO for 3-6 mo followed by high dose methotrexate (20-25 mg PO/SC weekly) or azathioprine (2 mg/kg/d PO once daily)
- consider biologic agents (rituximab, IVIG) and plasmapheresis (PEXIVAS trial)
- RAVE trial (NEJM 2010; 363:221-232): rituximab equivalent or superior to cyclophosphamide with less toxicity

### Classic Features

- Necrotizing granulomatous vasculitis of lower and upper respiratory tract
- Focal segmental glomerulonephritis

# Medium Vessel Vasculitis

## POLYARTERITIS NODOSA (PAN)

### Definition

- systemic, necrotizing vasculitis of medium sized vessels
- ANCA negative
- often associated with hepatitis B positivity
- incidence 0.7 per 100,000; affects individuals between 40-60 yr; M:F = 2:1

**Table 23. Classification Criteria for PAN. Diagnosed if 3 or more of the following 10 criteria present.**

Criteria	Description
1. Weight loss	>4 kg, not due to dieting or other factors
2. Myalgias, weakness or leg tenderness	Diffuse myalgias or weakness
3. Livedo reticularis	Mottled, reticular pattern over skin
4. Neuropathy	Mononeuropathy, mononeuropathy multiplex or polyneuropathy
5. Testicular pain or tenderness	Not due to infection, trauma or other causes
6. dBP >90 mmHg	Development of hypertension with dBP >90 mmHg
7. Elevated Cr or BUN	Cr >130 $\mu$ mol/L (1.5 mg/dL), BUN >14.3 mmol/L (40 mg/dL)
8. Hepatitis B positive	Presence of Hepatitis B surface antigen or antibody
9. Arteriographic abnormality	Commonly aneurysms
10. Biopsy of artery	Presence of granulocytes and/or mononuclear leukocytes in the artery wall

American College of Rheumatology, 1990

## Etiology and Pathophysiology

- focal panmural necrotizing inflammatory lesions in small and medium-sized arteries
- thrombosis, aneurysm, or dilatation at lesion site may occur
- healed lesions show proliferation of fibrous tissue and endothelial cells that may lead to luminal occlusion

There is an association between hepatitis B surface antigen (HBsAg) positivity and PAN.

Consider PAN in a non-diabetic patient with mononeuritis multiplex.

**Investigations**

- bloodwork: CBC, ESR, Cr, BUN, p-ANCA, hepatitis B serology
- imaging: angiography
- arterial biopsy

**Treatment**

- prednisone 1 mg/kg/d PO and cyclophosphamide 2 mg/kg/d PO
- ± anti-viral therapy to enhance clearance of HBV

## Large Vessel Vasculitis

- please see [Neurology](#), N39 and [Ophthalmology](#), OP38 for more details

**GIANT CELL ARTERITIS (GCA)/TEMPORAL ARTERITIS****Table 24. Classification Criteria for GCA. Diagnosed if 3 or more of the following 5 criteria present.**

Criteria	Description
1. Age at onset >50	
2. New headache	Often temporal
3. Temporal artery abnormality	Temporal artery tenderness or decreased pulsations, not due to arteriosclerosis
4. Elevated ESR	ESR >50 mm/h
5. Abnormal artery biopsy	Mononuclear cell infiltration or granulomatous inflammation, usually with multinucleated giant cells

American College of Rheumatology, 1990

**GCA Criteria**

Presence of 3 or more criteria yields sensitivity of 94%, specificity of 91%.

**Epidemiology**

- most frequent vasculitis in North America
- patients >50 yr
- F:M = 2:1
- North-South gradient (predominance in Northern Europe/US)
- affects extracranial arteries

**Signs and Symptoms**

- new onset temporal headache ± scalp tenderness due to inflammation of involved portion of the temporal or occipital arteries
- sudden, painless loss of vision and/or diplopia due to narrowing of the ophthalmic or posterior ciliary arteries (PCA more common); can affect both eyes
- tongue and jaw claudication (pain in muscles of mastication on prolonged chewing)
- polymyalgia rheumatica (proximal myalgia, constitutional symptoms, elevated ESR) occurs in 30% of patients
- aortic arch syndrome (involvement of subclavian and brachial branches of aorta result in pulseless disease), aortic aneurysm ± rupture are late complications

**Medical Emergency**

Untreated, GCA can lead to permanent blindness in 20-25% of patients!  
Treat on clinical suspicion.

**Investigations**

- diagnosis made by clinical suspicion, increased ESR, increased CRP, temporal artery biopsy within 14 d of starting steroids, possible ultrasound

**Treatment**

- if suspect GCA, immediately start high dose prednisone 1 mg/kg in divided doses for approximately 4 wk, and then tapering prednisone as symptoms resolve; highly effective in treatment and in prevention of blindness and other vascular complications
- consider low dose ASA

**Prognosis**

- increased risk of thoracic aortic aneurysm and aortic dissection
- yearly CXR ± abdominal ultrasound as screening

SERONEGATIVE RHEUMATIC DISEASE

Spondyloarthropathies

Table 25. A Comparison of the Spondyloarthropathies (inflammatory joint disease of the vertebral column)

Feature	Ankylosing Spondylitis	Psoriatic Arthritis	Reactive Arthritis	Enteropathic Arthritis
M:F	3:1	1:1	8:1	1:1
Age of onset	20s	35-45	20s	Any
Peripheral arthritis	25%	96%	90%	Common
Distribution	Axial, LE	Any	LE	LE
Sacroiliitis	100%	40%	80%	20%
Dactylitis	Uncommon	Occasional	Common	Uncommon
Enthesitis	Common	Common	Common	Less Common
Skin lesions	Rare	100% Psoriasis eventually 70% at onset of arthritis	Common Keratoderma	Occasional Pyoderma, erythema nodosum
Uveitis	30%	Occasional	20%	Rare
Urethritis	Rare	Occasional	Common	Rare
HLA-B27	90%	40%	80%	30%

LE = lower extremities

Figure 11. Spondyloarthropathy subsets (U-SpA = undifferentiated spondyloarthropathy)

Ankylosing Spondylitis (AS)

Definition

- chronic inflammatory arthritis involving the sacroiliac joints and vertebrae (see Figure 12)
- AS in women: more peripheral arthritis and upper spine spondylitis
- prototype of the spondyloarthropathies

Table 26. ASAS Classification Criteria for Axial Spondyloarthritis (for patients with ≥3 months back pain and age at onset <45 years)

Sacroiliitis on imaging plus ≥1 SpA feature or HLA B-27 positive plus ≥2 SpA features	
<b>SpA features:</b> <ul style="list-style-type: none"><li>• Inflammatory back pain</li><li>• Arthritis</li><li>• Enthesitis (heel)</li><li>• Uveitis</li><li>• Dactylitis</li><li>• Psoriasis</li><li>• Crohn's disease/colitis</li><li>• Good response to NSAIDs</li><li>• Family history of SpA</li><li>• HLA-B27 positive</li><li>• Elevated CRP</li></ul>	<b>Sacroiliitis on imaging:</b> <ul style="list-style-type: none"><li>• Active (acute) inflammation on MRI highly suggestive of sacroiliitis associated with SpA</li><li>• Definite radiographic sacroiliitis according to modified NY criteria</li></ul>

Etiology and Pathophysiology

- enthesitis (inflammation of tendon or ligament at site of attachment to bone)
- inflammation → osteopenia → erosion → ossification → osteoproliferation (syndesmophytes)

Epidemiology

- M:F = 5:1; females have milder disease which may be under-recognized
- 95% of patients have HLA-B27 (9% HLA-B27 positive in general population)

Figure 12. Common sites of involvement of AS

**Rule of 2s**  
**AS occurs in**  
0.2% of the general population  
2% of HLA-B27 positive individuals  
20% of HLA-B27 positive individuals with affected family member

Table 27. Types of Back Pain

Parameter	Mechanical	Inflammatory
Past History	±	++
Family History	–	+
Onset	Acute	Insidious
Age (years)	15-90	<40
Sleep Disturbance	±	++ (worse during 2nd half of night)
Morning Stiffness	<30 min	>1 h
Involvement of Other Systems	–	+
Exercise	Worse	Better
Rest	Better	Worse
Radiation of Pain	Anatomic (L5-S1)	Diffuse (thoracic, buttock)
Sensory Symptoms	+	–
Motor Symptoms	+	–

## Signs and Symptoms

### • axial

- mid and lower back stiffness, prolonged morning stiffness, night pain, persistent buttock pain, painful sacroiliac joint (+ Faber test) (see Table 27)
- spinal restriction (decreased ROM): lumbar (decreased Schöber), thoracic (decreased chest wall expansion, normal >5 cm at T4), cervical (global decrease, often extension first)
- postural changes: decreased lumbar lordosis + increased thoracic kyphosis + increased cervical flexion = increased occiput to wall distance (>5 cm)

### • peripheral

- asymmetrical large joint arthritis, most often involving lower limb
- enthesitis: tenderness over tibial tuberosity, or Achilles tendon and plantar fascia insertions into the calcaneus

### • extra-articular manifestations

- ophthalmic: acute anterior uveitis is common (25-30% patients)
- renal: amyloidosis (late and rare) and IgA nephropathy
- gastrointestinal: inflammatory bowel disease
- cardiac: aortitis, aortic regurgitation, pericarditis, conduction disturbances, heart failure (rare)
- respiratory: apical fibrosis (rare)
- neurologic: cauda equina syndrome (rare)
- skin: psoriasis

## Investigations

- x-ray of SI joint: “pseudowidening” of joint due to erosion with joint sclerosis → bony fusion (late), symmetric sacroiliitis
- x-ray of spine: “squaring of edges” from erosion and sclerosis on corners of vertebral bodies (shiny corner sign) leading to ossification of outer fibres of annulus fibrosis (bridging syndesmophytes) → “bamboo spine” radiographically
- MRI of spine: assess activity in early disease; detection of cartilage changes, bone marrow edema, bone erosions, and subchondral bone changes. Best seen on T2 STIR images (suppress fat and see bone edema)

## Treatment

### • conservative/non-pharmacologic

- prevent fusion from poor posture and disability through: exercise (e.g. swimming), postural and deep breathing exercises, outpatient PT, smoking cessation

### • medical

- NSAIDs (first line of treatment)
- glucocorticoids (topical eye drops, local injections)
- DMARDs for peripheral arthritis (sulfasalazine, methotrexate)
- biologics for axial and peripheral involvement
- manage extra-articular manifestations

### • surgical

- hip replacement, vertebral osteotomy for marked deformity

## Prognosis

- spontaneous remissions and relapses are common and can occur at any age
- function may be excellent despite spinal deformity
- favourable prognosis if female and age of onset >40 yr
- early onset with hip disease may lead to severe disability; may require arthroplasty

### Extra-articular Manifestations of AS

#### 6 As

Atlanto-axial subluxation  
Anterior uveitis  
Apical lung fibrosis  
Aortic incompetence  
Amyloidosis (kidneys)  
Autoimmune bowel disease (UC)

Consider AS in the differential for causes of aortic regurgitation.

The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) is a self-reported scoring system that focuses on fatigue, axial pain, peripheral pain, enthesitis, and morning stiffness.

## Enteropathic Arthritis (EA)

- see [Gastroenterology](#), *Inflammatory Bowel Disease*, G19
- MSK manifestations in the setting of either ulcerative colitis (UC) or Crohn's disease (CD) include peripheral arthritis (large joint, asymmetrical), spondylitis, and hypertrophic osteoarthropathy
- arthralgia, myalgia, osteoporosis and aseptic necrosis of bone 2° to steroid treatment of bowel inflammation
- NSAIDs should be used cautiously as they may exacerbate bowel disease

**Table 28. Comparing Features of Spondylitis vs. Peripheral Arthritis in EA**

Parameter	Spondylitis	Peripheral Arthritis
HLA-B27 association	Yes	No
Gender	M>F	M=F
Onset before IBD	Yes	No
Parallels IBD course	No	Yes
Type of IBD	UC=CD	CD

Both AS and EA feature symmetric sacroiliitis.

## Psoriatic Arthritis (PsA)

### Etiology and Pathophysiology

- unclear but many genetic, immunologic and some environmental factors involved (e.g. psoriatic plaque flora, particularly Group A *Streptococcus*, and trauma)

### Epidemiology

- psoriasis affects 1% of population
- arthropathy in 10% of patients with psoriasis
- 15-20% of patients will develop joint disease before skin lesions appear

### Signs and Symptoms

- **dermatologic**
  - well-demarcated erythematous plaques with silvery scale
  - nail involvement: pitting, transverse or longitudinal ridging, discolouration, subungual hyperkeratosis, onycholysis, and oil drops
- **musculoskeletal**
  - 5 general patterns
    - ♦ asymmetric oligoarthritis (most common – 70%)
    - ♦ arthritis of DIP joints with nail changes
    - ♦ destructive (mutilans) arthritis (5%)
    - ♦ symmetric polyarthritis (similar to RA)
    - ♦ sacroiliitis and spondylitis (usually older, male patients)
  - other findings: dactylitis, enthesopathy
- **ophthalmic**
  - conjunctivitis, iritis (anterior uveitis)
- **cardiac and respiratory** (late findings)
  - aortic insufficiency
  - apical lung fibrosis
- **neurologic**
  - cauda equina syndrome
- **radiologic**
  - floating syndesmophytes
  - pencil-in-cup appearance at IP joints
  - osteolysis, periostitis

### Treatment

- treat skin lesions (e.g. steroid cream, salicylic and/or retinoic acid, tar, UV light)
- NSAIDs or intra-articular steroids
- DMARDs, biologic therapies to minimize erosive disease (use early if peripheral joint involvement)

Check “hidden” areas for psoriatic lesions (ears, hair line, umbilicus, gluteal cleft, nails).

**Risks and Benefits of Tumour Necrosis Factor- $\alpha$  Inhibitors in the Management of Psoriatic Arthritis (PsA): Systematic Review and Meta-analysis of Randomized Controlled Trials**  
*J Rheumatol* 2008;35:883-890

**Study:** Review of RCTs of adalimumab, etanercept, and infliximab used in patients with PsA.

**Results:** Six RCTs were included (n=982). All 3 TNF $\alpha$  inhibitors were significantly more effective than placebo on the basis of Psoriatic Arthritis Response Criteria (PsARC) and American College of Rheumatology response criteria ACR20, ACR50, and ACR70 ratings. There were no significant differences between TNF- $\alpha$  inhibitors and placebo in the proportions of patients who withdrew for any reason (RR 0.48, 95% CI 0.20-1.18), or withdrawal due to adverse events (RR 2.14, 95% CI 0.73-6.27), serious adverse events (RR 0.98, 95% CI 0.55-1.77), or upper respiratory tract infections (RR 0.91, 95% CI 0.65-1.28). Pooled rates for injection site reactions were significantly higher for adalimumab and etanercept than for placebo (RR 2.48, 95% CI 1.16-5.29), but there was no significant difference in the proportion of patients experiencing infusion reactions with infliximab (RR 1.03, 95% CI 0.48-2.20) compared to placebo. Indirect analysis did not demonstrate any significant differences between the TNF- $\alpha$  inhibitors.

**Conclusions:** TNF- $\alpha$  inhibitors are effective treatments for PsA with no important added risks associated with their short-term use. There is still a need for long-term risk-benefit assessment of use of these drugs for the management of PsA.

## Reactive Arthritis (ReA)

### Definition

- two meanings
  1. Reactive arthritis: a sterile arthritis following an infection (e.g. rheumatic fever, post-viral arthritis, etc.), not used frequently by rheumatologists
  2. Reactive Arthritis (ReA): one of the seronegative spondyloarthropathies in which patients have a peripheral arthritis ( $\geq 1$  mo duration) accompanied by one or more extra-articular manifestations that appears shortly after certain infections of the GI or GU tracts

### Etiology

- onset following an infectious episode either involving the GI or GU tract
  - GI: *Shigella*, *Salmonella*, *Campylobacter*, *Yersinia* species
  - GU: *Chlamydia* (isolated in 16-44% of ReA cases), *Mycoplasma* species
- acute clinical course
  - 1-4 wk post-infection
  - lasts weeks to years
  - often recurring
  - spinal involvement persists

### Epidemiology

- in HLA-B27 patients, axial > peripheral involvement
- M>F

### Signs and Symptoms

- musculoskeletal**
  - peripheral arthritis, asymmetric pattern, spondylitis, Achilles tendinitis, plantar fasciitis, dactylitis
- ophthalmic**
  - iritis (anterior uveitis), conjunctivitis
- dermatologic**
  - keratoderma blenorrhagicum (hyperkeratotic skin lesions on palms and soles) and balanitis circinata (small, shallow, painless ulcers of glans penis and urethral meatus) are diagnostic
- gastrointestinal**
  - oral ulcers, diarrhea
- urethritis and cervicitis**
  - sterile cultures; presence not related to site of initiating infection

### Investigations

- diagnosis is clinical plus laboratory
- bloodwork: normocytic, normochromic anemia and leukocytosis
- sterile cultures
- serology: HLA-B27 positive

### Treatment

- antibiotics for non-articular infections
- NSAIDs, physical therapy, exercise
- local therapy
  - joint protection
  - intra-articular steroid injection
  - topical steroid for ocular involvement
- systemic therapy
  - corticosteroids, sulfasalazine, methotrexate (for peripheral joint involvement only)
  - TNF- $\alpha$  inhibitors for spinal inflammation

### Prognosis

- self-limited, typically 3-5 mo, varies based on pathogen and patient's genetic background
- chronic in 15-20% of cases

#### Clinical triad of reactive arthritis:

- Arthritis
- Conjunctivitis
- Urethritis/cervicitis

#### "Can't see, can't pee, can't climb a tree":

Triad of conjunctivitis, urethritis, and arthritis is 99% specific (but 51% sensitive) for ReA.

## Crystal-Induced Arthropathies

Table 29. Gout vs. Pseudogout

Parameter	Gout	Pseudogout
Gender	M>F	M=F
Age	Middle-aged males Post-menopausal females	Age >60
Onset of disease	Acute	Acute/insidious
Crystal type	Monosodium urate (MSU) Negative birefringence (yellow when parallel to compensator filter), needle-shaped	Calcium pyrophosphate dihydrate (CPPD) Positive birefringence (blue when parallel), rhomboid-shaped
Distribution	First MTP classically; also midfoot, ankle, knee, or polyarticular	Knee, wrist; typically monoarticular
Radiology (note findings are non-specific)	Erosions	Chondrocalcinosis OA (knee, wrist, 2nd and 3rd MCP)
Treatment	NSAIDs, corticosteroids, colchicine, Allopurinol, febuxostat	NSAIDs, corticosteroids

## Gout

### Definition

- derangement in purine metabolism resulting in hyperuricemia; monosodium urate crystal deposits in tissues (tophi) and synovium (microtophi)

### Etiology and Pathogenesis

- sources of uric acid: diet and endogenous
- synthesis
  - hypoxanthine → xanthine → uric acid
  - both steps catalyzed by xanthine oxidase

### Hyperuricemia

- primary or genetic**
  - mostly due to idiopathic renal underexcretion (90%)
  - also idiopathic overproduction or abnormal enzyme production/function
- secondary**
  - dietary excess (particularly high consumption of beer, seafood, and meat)
  - underexcretion (>90%): renal failure, drugs, systemic conditions
  - overproduction (<10%): increased nucleic acid turnover states (e.g. malignancy, post-chemotherapy)
- sudden changes (increasing or decreasing) in uric acid concentration are more important than absolute values
  - acute gout can occur with normal serum uric acid
  - changes in pH, temperature or initiation of antihyperuricemics may precipitate an acute gouty attack
- common precipitants: alcohol, dietary excess, dehydration, drugs (e.g. thiazide and loop diuretics), trauma, illness, surgery, starting xanthine oxidase inhibitor therapy
- other associated conditions: hypertension, obesity, diabetes, starvation

### Epidemiology

- most common in males >45 yr old
- extremely rare in premenopausal female

### Signs and Symptoms

- single episode progressing to recurrent episodes of acute inflammatory arthritis
- acute gouty arthritis**
  - severe pain, redness, joint swelling, usually involving lower extremities (see Figure 13)
  - joint mobility may be limited
  - attack will subside spontaneously within several days to weeks; may recur
- tophi**
  - urate deposits on cartilage, tendons, bursae, soft tissues, and synovial membranes
  - common sites: first MTP, ear helix, olecranon bursae, tendon insertions (common in Achilles tendon)
- kidney**
  - gouty nephropathy
  - uric acid calculi

### Investigations

- joint aspirate: >90% of joint aspirates show crystals of monosodium urate (see Table 29) (negatively birefringent, needle-shaped)
- x-rays may show tophi as soft tissue swelling, punched-out lesions – erosion with “overhanging” edge

### Treatment

- acute gout**
  - NSAIDs: high dose, then taper as symptoms improve
  - corticosteroids: intra-articular, oral or intra-muscular (if renal, cardiovascular, or GI disease and/or if NSAIDs contraindicated or failed)
  - colchicine within first 12 h but effectiveness limited by narrow therapeutic range
  - allopurinol can worsen an acute attack (do not start during acute flare)
- chronic gout**
  - conservative
    - avoid foods with high purine content (e.g. visceral meats, sardines, shellfish, beans, peas)
    - avoid drugs with hyperuricemic effects (e.g. pyrazinamide, ethambutol, thiazide, alcohol)
  - medical
    - antihyperuricemic drugs (allopurinol and febuxostat): decrease uric acid production by inhibiting xanthine oxidase
    - uricosuric drugs (probenecid, sulfinpyrazone): use if failure on or intolerant to allopurinol; do not use in renal failure
    - prophylaxis prior to starting antihyperuricemic drugs (colchicine/low-dose NSAID)
    - in renal disease secondary to hyperuricemia, use low-dose allopurinol and monitor creatinine
- indications for treatment with antihyperuricemic medications include:
  - recurrent attacks, tophi, bone erosions, urate kidney stones. Perhaps in renal dysfunction with very high urate load (controversial)

**Figure 13. Common sites of involvement in gout**  
(asymmetric joint involvement)

An acute gout attack may mimic cellulitis. However, joint mobility is preserved in cellulitis. Gout often affects more than one joint (i.e. ankle, midfoot and MTPs).

#### Precipitants of Gout

##### Drugs are FACT

Furosemide  
Aspirin®/Alcohol  
Cytotoxic drugs  
Thiazide diuretics

##### Foods are SALT

Seafood  
Alcohol (beer and spirits)  
Liver and kidney  
Turkey (meat)

- The majority of people with hyperuricemia do not have gout
- Normal or low uric acid levels do not rule out gout

## Pseudogout (Calcium Pyrophosphate Dihydrate Disease)

### Etiology and Pathophysiology

- acute inflammatory arthritis due to phagocytosis of IgG-coated calcium pyrophosphate dihydrate (CPPD) crystals by neutrophils and subsequent release of inflammatory mediators within joint space

### Epidemiology

- more frequently polyarticular
- slower in onset in comparison to gout, lasts up to 3 wk but is self-limited

### Risk Factors

- old age, advanced OA, neuropathic joints
- other associated conditions: hyperparathyroidism, hypothyroidism, hypomagnesemia, hypophosphatasia (low ALP), diabetes, hemochromatosis

### Signs and Symptoms

- affects knees, wrists, MCPs, hips, shoulders, elbows, ankles, big toe (see Figure 14)
- multiple manifestations:
  - asymptomatic crystal deposition (seen on radiograph only)
  - acute crystal arthritis (self-limited flares of acute inflammatory arthritis resembling gout)
  - pseudo-osteoarthritis (progressive joint degeneration, sometimes with episodes of acute inflammatory arthritis)
  - pseudo-rheumatoid arthritis (symmetrical polyarticular pattern with morning stiffness and constitutional symptoms)
- acute may be triggered by dehydration, acute illness, surgery, trauma

### Investigations

- must aspirate joint to rule out septic arthritis, gout
- CPPD crystals: present in 60% of patients, often only a few crystals
- x-rays show chondrocalcinosis in 75%: radiodensities in fibrocartilaginous structures (e.g. knee menisci) or linear radiodensities in hyaline articular cartilage

### Treatment

- joint aspiration, rest, and protection
- NSAIDs: also used for maintenance therapy
- prophylactic colchicine PO (controversial)
- intra-articular or oral steroids to relieve inflammation

**Figure 14. Common sites of involvement in CPPD**

## Pediatric Rheumatology

- see [Pediatrics](#), P96

## Non-Articular Rheumatism

### Definition

- disorders that primarily affect soft tissues or periarticular structures
- includes bursitis, tendinitis, tenosynovitis, fibromyalgia, and polymyalgia rheumatica

## Polymyalgia Rheumatica (PMR)

### Definition

- characterized by pain and stiffness of the proximal extremities (girdle area)
- closely related to giant cell arteritis (15% of patients with PMR develop GCA)
- no muscle weakness

**Table 30. PMR Classification Criteria Scoring Algorithm****Required criteria: age  $\geq 50$ , bilateral shoulder aching, and abnormal ESR/CRP**

	Points without U/S (0-6)	Points with Abnormal U/S* (0-8)
Morning stiffness duration $>45$ min	2	2
Hip pain or limited ROM	1	1
Absence of RF or ACPA	2	2
Absence of other joint involvement	1	1
At least one shoulder with subdeltoid and/or biceps tenosynovitis and/or glenohumeral synovitis (either posterior or axillary) and at least one hip with synovitis and/or trochanteric bursitis on U/S	N/A	1
Both shoulders with subdeltoid bursitis, biceps tenosynovitis or gleno-humeral synovitis on U/S	N/A	1

Ann Rheum Dis 2012;71:484-492

\*\*A score of 4 or more is categorized as PMR in the algorithm without U/S and a score of 5 or more is categorized as PMR in the algorithm with U/S

\*\*Optional U/S criteria

**Epidemiology**

- incidence 50 per 100,000 per year in those over age 50
- age of onset typically  $>50$ , F:M = 2:1

**Signs and Symptoms**

- constitutional symptoms prominent (fever, weight loss, malaise)
- pain and stiffness of symmetrical proximal muscles (neck, shoulder and hip girdles, thighs)
- gel phenomenon (stiffness after prolonged inactivity)
- physical examination reveals tender muscles, but no weakness or atrophy

**Investigations**

- bloodwork: often shows anemia, elevated platelets, elevated ESR and CRP; normal CK up to 5% of PMR reported with normal inflammatory markers

**Treatment**

- goal of therapy: symptom relief
- start with prednisone dose of 15-20 mg PO once daily
- taper slowly over 2-yr period monitoring ESR and symptoms closely
- treat relapses aggressively (50% relapse rate)
- monitor for steroid side effects, glucocorticoid-induced osteoporosis prevention, follow for symptoms of giant cell arteritis

Most patients are treated for up to 2 years.

**Prednisone Plus Methotrexate for PMR**

Ann Intern Med 2004;141:493-500

Study: Multicenter RCT.

Patients: Patients with newly diagnosed PMR.

Intervention: Prednisone dosage (25 mg/d) was tapered to 0 mg/d within 24 wk and was adjusted if flare-ups occurred. Oral methotrexate (10 mg) or placebo with folic acid supplementation (7.5 mg) was given weekly for 48 wk.

Primary Outcome: The proportion of patients no longer taking prednisone, the number of flare-ups, and the cumulative prednisone dose after 76 wk.

Results: 28 of 32 patients in the methotrexate group and 16 of 30 patients in the placebo group were no longer taking prednisone at 76 wk ( $p = 0.003$ ). Similar results were obtained after adjustment for C-reactive protein level and duration of symptoms in a multivariate model. 15 of 32 patients in the methotrexate group and 22 of 30 patients in the placebo group had at least 1 flare-up by the end of follow-up ( $p = 0.04$ ). The median prednisone dose was 2.1 g in the methotrexate group and 2.97 g in the placebo group ( $p = 0.03$ ). The rate and severity of adverse events were similar.

Limitations: Follow-up was short, and a high dose of folic acid and a relatively high starting dosage of prednisone were used. 10 of 72 patients (14%) discontinued treatment or were lost to follow-up.

Conclusions: Prednisone plus methotrexate is associated with shorter prednisone treatment and steroid sparing. It may be useful in patients at high risk for steroid-related toxicity.

## Fibromyalgia

**Definition**

- chronic ( $>3$  mo), widespread (axial, left- and right-sided, upper and lower segment), non-articular pain with characteristic tender points

**Diagnosis****2010 Diagnostic Criteria for Fibromyalgia**

- Widespread pain index (WPI)  $\geq 7$  and symptom severity score (SS)  $\geq 5$  or WPI 3-6 and SS  $\geq 9$
- Symptoms have been present at a similar level for  $\geq 3$  mo
- The patient does not have a disorder that would otherwise explain the pain
  - WPI = number of areas in which the patient had pain over the last week (L and R: shoulder girdle, upper arm, lower arm, hip, upper leg, lower leg, jaw, chest, abdomen, upper and lower back, neck = max score 19)
  - SS = sum of a) severity of fatigue, b) waking unrefreshed, and c) cognitive symptoms over the past week, plus d) extent of somatic symptoms (IBS, headache, abdominal pain/cramps, dry mouth, fever, hives, ringing in ears, vomiting, heartburn, dry eyes, SOB, loss of appetite, rash, hair loss, easy bruising, etc.); all (a-d) rated on 0-3 scale: 0=no problem, 1 = mild, 2 = moderate, 3 = severe
- this clinical definition identified 88.1% of ACR classified fibromyalgia and can allow longitudinal assessment of symptom severity

**Epidemiology**

- F:M = 3:1
- primarily ages 25-45, some adolescents
- prevalence of 2-5% in general population
- overlaps with chronic fatigue syndrome and myofascial pain syndrome
- strong association with psychiatric illness

## Signs and Symptoms

- widespread aching, stiffness
- easy fatigability
- sleep disturbance: non-restorative sleep, difficulty falling asleep, and frequent waking
- symptoms aggravated by physical activity, poor sleep, emotional stress
- patient feels that joints are diffusely swollen although joint examination is normal
- neurologic symptoms of hyperalgesia, paresthesias
- associated with irritable bowel or bladder syndrome, migraines, tension headaches, restless legs syndrome, obesity, depression, and anxiety

## Investigations

- bloodwork: includes TSH and ESR; all typically normal unless unrelated, underlying illness present
- serology: do not order ANA or RF unless there is clinical suspicion for a connective tissue disease
- laboratory sleep assessment

## Differential Diagnosis

- diagnosis of exclusion
- rule out other disorders by history and physical exam

## Treatment

- **conservative**
  - education
  - exercise program (walking, aquatic exercises), physical therapy (good posture, stretching, muscle strengthening, massage)
  - stress reduction, CBT
  - biofeedback, meditation, acupuncture may be helpful
- **medical**
  - low dose tricyclic antidepressant (e.g. amitriptyline)
    - ♦ for sleep restoration
    - ♦ select those with lower anticholinergic side effects
  - SNRI: duloxetine, milnacipran
  - anticonvulsant: pregabalin, gabapentin
  - analgesics may be beneficial for pain that interferes with sleep (NSAIDs, not narcotics)

## Prognosis

- variable; usually chronic, unless diagnosed and treated early

# Adult Onset Still's Disease

## Definition

- systemic inflammatory condition (ANA and RF negative) with fevers and characteristic rash, numerous systemic symptoms, may have severe arthritis

## Etiology and Pathophysiology

- idiopathic; infectious triggers likely – various viruses and bacteria have been implicated
- stress increases risk

## Epidemiology

- F>M; age of onset typically 16-40, approximately 1 per 100,000

## Signs and Symptoms

- classic triad of symptoms:
  - high-spiking fevers (95.7% of patients, typically T 39°C, <4 h duration, quotidian pattern)
  - characteristic "salmon rash" (~72% of patients, on proximal limbs + trunk)
  - arthralgia/arthritis (64-100%)
- sore throat, myalgias and serositis may also occur
- arthritis is symmetric, typically affects large joints, i.e. wrists, knees and ankles, may involve PIP and DIPs, elbow, MTPs
- liver abnormalities ± hepatomegaly (50-75% patients)
- splenomegaly (44%)

### A 14-week, RCT of Pregabalin in Patients with Fibromyalgia

*J Pain* 2008;9:792-880

**Study:** Multicenter RCT. 750 patients with fibromyalgia with pain score of <40 mm on the visual analog scale (VAS) were assigned to placebo or pregabalin (300 mg, 450 mg, or 600 mg) daily for 12 wk.

**Primary Outcome:** Change in the mean pain score derived from the subject's daily pain diary as measured at the patient's baseline to the end point of the study.

**Results:** Patients treated with 450 and 600 mg/d pregabalin showed a statistically significant improvement in the end point mean pain score compared with placebo-treated subjects by -0.50 and -0.45 respectively.

The 30% responder rate was 30%, 42%, 50%, and 48% in the placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. The 50% responder rate was 15%, 24%, 27%, and 30% for placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. Discontinuations due to adverse events were 12%, 16%, 22%, and 26% in placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. The 450 and 600 mg/d groups were significantly different from placebo (P = .0001).

**Conclusions:** Pregabalin at 300 mg/d, 450 mg/d, and 600 mg/d showed statistically significant response rates as compared to placebo although discontinuation rates for the 450 mg/d and 600 mg/d regimens were significantly higher as compared to placebo.

### Exercise for Treating Fibromyalgia Syndrome

*Cochrane DB Syst Rev* 2008;CD003786

**Study:** Systemic review of exercise training including cardiorespiratory endurance, muscle strengthening, and flexibility for global well-being and physical function in patients with fibromyalgia.

**Result:** 34 studies were included (n=2276). Aerobic-only exercises improve global well-being, physical function, and possibly pain and tender points. There was insufficient data to evaluate the effect of strength and flexibility on the primary outcomes.

**Conclusions:** Moderate aerobic cardiorespiratory exercise improves function and well-being in patients with FM. Benefits from strength and flexibility require additional research to delineate benefits.

### Triad of Still's Disease

**FAR**

Fever

Arthralgias/Arthritis

Rash

### Classification

- numerous classification systems proposed
- Yamaguchi's criteria (J Rheumatol 1992;19:424-30) need 5 criteria to diagnose Still's, at least 2 major
  - major criteria
    - ♦  $T > 39^{\circ}\text{C}$ , intermittent,  $>1$  wk
    - ♦ typical rash
    - ♦  $\text{WBC} > 10,000$  ( $>80\%$  granulocytes)
  - minor criteria
    - ♦ sore throat
    - ♦ lymphadenopathy  $\pm$  splenomegaly
    - ♦ abnormal transaminases
    - ♦ negative ANA and RF
  - exclusion criteria: infection, malignancy, rheumatic disease

### Investigations

- ANA and RF negative
- markedly elevated ESR, CRP, ferritin (typically  $>1000$  ng/mL,  $>2200$  pmol/L)
  - total ferritin  $>5$  times ULN = 80% sensitive, 41% specific
- anemia, thrombocytosis, leukocytosis may occur
- transaminases, LDH may be elevated

### Treatment

- 1st line therapy: methotrexate + low-dose glucocorticoids  $\pm$  NSAIDs
- 2nd line therapy: other DMARDs (i.e. hydroxychloroquine, azathioprine, anti-IL1 and IL6 agents)

## Common Medications

**Table 31. Common Medications for Osteoarthritis**

Class	Generic Drug Name	Trade Name	Dosing (PO)	Indications	Contraindications	Adverse Effects
<b>NSAIDs</b>						
	acetaminophen	Tylenol®	500 mg tid q4h (4 g daily max)	1st line		Hepatotoxicity Overdose Potentiates warfarin
	ECASA ibuprofen diclofenac diclofenac/misoprostol naproxen meloxicam	Entrophen® Advil®, Motrin® Voltaren® Arthrotec® Naprosyn®, Aleve® Mobicox®	325-975 mg qid 200-600 mg tid 25-50 mg tid 50-75/200 mg tid 125-500 mg bid 7.5-15 mg OD	2nd line	GI bleed Renal impairment Allergy to ASA, NSAIDs Pregnancy (T3)	Nausea, tinnitus, vertigo, rash, dyspepsia, GI bleed, PUD, hepatitis, renal failure, HTN, nephrotic syndrome
<b>COX-2 INHIBITORS</b>						
	celecoxib	Celebrex®	200 mg OD	High risk for GI bleed: age $>65$ hx of GI bleed, PUD	Renal impairment Sulfa allergy (celecoxib) Cardiovascular disease	Delayed ulcer healing Renal/hepatic impairment Rash
<b>Other treatments</b>		<b>Comments</b>				
Combination analgesics (acetaminophen + codeine, acetaminophen + NSAIDs)		Enhanced short term effect compared to acetaminophen alone More adverse effects: sedation, constipation, nausea, GI upset				
Intra-articular corticosteroid injection		Short-term (weeks-months) decrease in pain and improvement in function Used for management of an intraarticular inflammatory process when infection has been ruled out				
Intra-articular hyaluronic acid q6mo		Used for mild-moderate OA of the knees, however little supporting evidence, and not considered to be effective Precaution with chicken/egg allergy				
Topical NSAIDs		1.5% wt/wt topical diclofenac (Pennsaid®) May use for patients who fail acetaminophen treatment and who wish to avoid systemic therapy				
Capsaicin cream		Mild decrease in pain				
Glucosamine sulfate $\pm$ chondroitin		Limited clinical studies No regulation by Health Canada				

Table 32. Disease Modifying Anti-Rheumatic Drugs (DMARDs)

Generic Drug Name	Trade Name	Dosing	Contraindications	Adverse Effects
COMMONLY USED				
hydroxychloroquine \$	Plaquenil®	400 mg PO OD initially 200-400 mg PO OD maintenance (6.5 mg/kg ideal body weight per day)	Retinal disease, G6PD deficiency	GI symptoms, skin rash, macular damage, neuromyopathy Requires regular ophthalmological screening to monitor for retinopathy
sulfasalazine \$	Salazopyrim® Azulfidine® (US)	1000 mg PO bid-tid	Sulfa/ASA allergy, kidney disease, G6PD deficiency	GI symptoms, rash, headache, leukopenia
methotrexate \$	Rheumatrex® Folex/Mexate®	7.5-25 mg PO/IM/SC qweekly	Bone marrow suppression, liver disease, significant lung disease, immunodeficiency, pregnancy, EtOH abuse	Oral ulcers, GI symptoms, cirrhosis, myelosuppression, pneumonitis, tubular necrosis
leflunomide \$\$	Arava®	10-20 mg PO OD	Liver disease	Alopecia, GI symptoms, liver dysfunction, pulmonary infiltrates
NOT COMMONLY USED				
cyclosporine \$\$	Neoral®	2.5-3 mg/kg/d divided and given in 2 doses PO	Kidney/liver disease, infection, hypertension	Hypertension, decreased renal function, hair growth, tremors, bleeding
gold (injectable) \$	Solganal® Mycrysine®	50 mg IM q1wk after gradual introduction	IBD, kidney/liver disease	Rash, mouth soreness/ulcers, proteinuria, marrow suppression
azathioprine \$	Imuran®	2/5 mg/kg/d PO once daily	Kidney/liver disease TPMT deficiency	Rash, pancytopenia (esp. ↓ WBC, ↑ AST, ALT), biliary stasis, vomiting, diarrhea
cyclophosphamide \$	Cytoxan®	1 g/m <sup>2</sup> /mo IV as per protocol	Kidney/liver disease	Cardiotoxicity, GI symptoms, hemorrhagic cystitis, nephrotoxicity, bone marrow suppression, sterility
Generic Drug Name	Trade Name	Dosing	Mechanism of Action	
NEWER DMARDs (Biologics)				
etanercept \$\$\$	Enbrel®	25 mg biweekly or 50 mg weekly SC	Fusion protein of TNF receptor and Fc portion of IgG	
infliximab \$\$\$	Remicade®	3-5 mg/kg IV q8wk	Chimeric mouse/human monoclonal anti-TNF-α	
adalimumab \$\$\$	Humira®	40 mg SC q2wk	Monoclonal anti-TNF-α	
abatacept \$\$\$	Orencia®	IV infusion	Costimulation modulator of T-cell activation	
rituximab \$\$\$	Rituxan®	2 IV infusions, 2 wk apart	Causes B-cell depletion, binds to CD20	
certolizumab \$\$\$	Cimzia®	400 mg SC q2wk x3 then 200 mg SC q4wk	PEGylated monoclonal anti-TNF-α	
golimumab \$\$\$	Simponi®	50 mg SC q month	Monoclonal anti-TNF-α	
tocilizumab \$\$\$	Actemra®	4-8 mg/kg IV q4wk	Interleukin-6 receptor antagonist	

**Risks of Biologics:**

- Reactivation of TB or hepatitis B. Patients require negative TB skin test, chest x-ray and negative HBV serology prior to starting any of these medications
- Increased risk of serious infections
- Worsening heart failure

## Landmark Rheumatology Trials

Trial	Reference	Results
<b>RHEUMATOID ARTHRITIS</b>		
ATTEST	<i>Ann Rheum Dis</i> 2008; 67:1096-103	Abatacept and infliximab have similar efficacy in RA patients who have failed methotrexate
ATTRACT	<i>Lancet</i> 1999; 354:1932-9	Infliximab and methotrexate combined are more effective than methotrexate alone for patients with active RA
CIMESTRA	<i>Arthritis Rheum</i> 2006; 54:1401-9	Combination of methotrexate and sulfasalazine is superior to either alone
COMET	<i>Lancet</i> 2008; 372:375-82	Etanercept add-on therapy increases rates of remission in early RA
ERA	<i>NEJM</i> 2000; 343:1586-93	Etanercept more rapidly decreases symptoms in early RA compared to methotrexate
European Leflunomide Study Group	<i>Lancet</i> 1999; 353:259-66	Leflunomide is equal in efficacy to sulphasalazine
FIN-RACo	<i>Lancet</i> 1999; 353:1568-73	Combination therapy with DMARDs improves remission rates in early RA
Infliximab and methotrexate	<i>NEJM</i> 2000; 343:1594-602	Infliximab combined with methotrexate reduces joint damage in RA
Leflunomide Rheumatoid Arthritis Investigators Group	<i>Arch Intern Med</i> 1999; 159:2542-50	Leflunomide is equivalent to methotrexate therapy and superior to placebo
PREMIER	<i>Arthritis Rheum</i> 2006; 54:26-37	Combination therapy with adalimumab and methotrexate is superior to either alone in patients with early RA
Swefot	<i>Lancet</i> 2009; 374:459-66	Anti-TNF agents are more effective second-line therapy than DMARDs in patients who fail methotrexate
<b>OSTEOARTHRITIS</b>		
GAIT	<i>NEJM</i> 2006; 354:795-808	Glucosamine, chondroitin and the combination of both were no more effective than placebo in treatment of knee osteoarthritis
Hyaluronan	<i>Ann Rheum Dis</i> 2010; 69:1097-102	Hyaluronan injections do not improve disease activity in patients with moderate-severe knee OA
<b>LUPUS</b>		
Belimumab	<i>Lancet</i> 2011; 377:721-31	Treatment with belimumab reduces the incidence of BILAG A and B flares in patients with lupus compared to placebo
BILAG open-RCT	<i>Rheumatology</i> 2010; 49:723-32	Low dose cyclosporine and azathioprine are equivalent in efficacy as maintenance therapy for lupus
Mycophenylate mofetil or intravenous cyclophosphamide	<i>NEJM</i> 2005; 353:2219-28	Mycophenylate mofetil is more efficacious than cyclophosphamide in inducing remission of lupus nephritis
<b>CONNECTIVE TISSUE DISEASES</b>		
Azathioprine or methotrexate maintenance for ANCA-associated vasculitis	<i>NEJM</i> 2008; 359:2790-803	Methotrexate and azathioprine are equally safe and effective as maintenance agents in ANCA vasculitis
Cyclophosphamide in scleroderma lung disease	<i>NEJM</i> 2006; 354:2655-66	Cyclophosphamide therapy led to transient improvements in lung function, skin scores, and overall health in patients with scleroderma
Etanercept plus standard therapy for granulomatosis with polyangiitis	<i>NEJM</i> 2005; 352:351-61	Etanercept is not effective in inducing remission in patients with ANCA vasculitis
Mycophenylate mofetil vs. azathioprine for maintenance in ANCA-associated vasculitis	<i>JAMA</i> 2010; 304:2381-8	Mycophenylate mofetil is less effective than azathioprine at inducing remission in ANCA-associated vasculitis
Rituximab versus cyclophosphamide for ANCA-associated vasculitis.	<i>NEJM</i> 2010; 363:221-32	Rituximab is not inferior to cyclophosphamide for induction of maintenance in ANCA vasculitis
<b>GOUT</b>		
Febuxostat vs. allopurinol	<i>NEJM</i> 2005; 353:2450-61	Febuxostat is more effective than allopurinol at lowering serum urate, and has similar effectiveness on flare reduction

Trial	Reference	Results
<b>ANKYLOSING SPONDYLITIS</b>		
Adalimumab	<i>Arthritis Rheum</i> 2006; 54:2136-46	Adalimumab induced partial remission in 22% of AS patients
ATLAS (adalimumab)	<i>J Rheumatol</i> 2008; 35:1346-53	Compared to placebo, adalimumab significantly reduces pain and fatigue in AS patients
ASSERT (rituximab)	<i>Arthritis Rheum</i> 2005; 52:582-91	Sixty percent of patients treated with rituximab had a clinical response to the medication
Infliximab in AS	<i>Lancet</i> 2002; 359:1187-93	Infliximab induces regression of symptoms in 50% of patients and is superior to placebo
SPINE (etanercept)	<i>Ann Rheum Dis</i> 2011; 70:799-804	ETN has short-term efficacy for patients with advanced AS and reduces disease severity
Sulfasalazine	<i>Arthritis Rheum</i> 1995; 38:618-27	Sulfasalazine is superior to placebo in treatment of patients with seronegative spondyloarthropathy

EBRT	external beam radiation therapy						

## Basic Anatomy Review

- recall that the anatomical position of the penis is erect. Therefore, the anatomical ventral side of the penis appears to be the dorsal side of the flaccid penis.

Figure 1. Midline cross-section of abdominal wall

Figure 2. Anatomy of scrotum

Figure 3. Essential genito-urinary tract anatomy

Figure 4. Cross section of the penis

Figure 5. Median sagittal section of the male pelvis and perineum

## Urologic History

- follow the OPQRSTUVW approach
  - note that pain may not be limited to the genital region (e.g. lower abdomen, CVA)
- inquire about risk factors: past urologic disease (e.g. UTI, stones, STI, cancers, anatomic abnormalities, family hx, medications, lifestyle factors, trauma, previous surgical procedures)
- constitutional symptoms: fever, chills, unintentional weight loss, night sweats, fatigue, malaise
- urinary output:
  - storage symptoms: frequency, nocturia, urgency, dysuria
  - voiding symptoms: straining, hesitancy, intermittency, post-void dribbling, reduced stream, feeling of incomplete voiding
  - hematuria: part of stream during which bleeding occurs, blood clots
  - incontinence: rushing to washroom (urge); leakage with coughing, sneezing, laughing (stress); constant dribbling (overflow)
- sexual function:
  - scrotal mass: see *Scrotal Mass*, U28
  - ED: see *Erectile Dysfunction*, U30
  - infertility: see *Infertility*, U34
- risk factors:
  - past urologic disease (e.g. UTI, stones, cancers, STI), anatomic abnormalities, trauma, previous surgical procedures, medications, family hx, lifestyle factors
- associated symptoms:
  - nausea/vomiting
- constitutional symptoms:
  - fever, chills, unintentional weight loss, night sweats, fatigue, malaise

Always ask about sexual function on history. Change in erectile function can be one of the first symptoms that there is concomitant coronary artery disease. If there is new onset ED, ask about chest pain with exertion.

# Common Presenting Problems

## Macroscopic (Gross) Hematuria

### Definition

- blood in the urine that can be seen with the naked eye

**Classification** (see [Nephrology](#), NP21)

### Etiology

**Table 1. Etiology by Age Group**

Age (years)	Etiology
0-20	UTI, glomerulonephritis, congenital abnormalities
20-40	UTI, stones, bladder tumour
40-60	Male: bladder tumour, stones, UTI Female: UTI, stones, bladder tumour
>60	Male: BPH, bladder tumour, UTI, RCC Female: bladder tumour, UTI, RCC

**Table 2. Etiology by Type**

Pseudo-hematuria	Pre-renal	Renal	Post-renal
Vaginal bleeding	Anticoagulants	Trauma	BPH
Dyes (beets, rhodamine B in candy and juices)	Coagulation defects	RCC (mainly in adult population)	Stone
Hemoglobin (hemolytic anemia)	Sickle cell disease	TCC	Neoplasms
Myoglobin (rhabdomyolysis)	Leukemia	Wilms' tumour (mainly in pediatric population)	Cystitis
Drugs (rifampin, phenazopyridine, phenytoin)	Thromboembolism	Pyelonephritis	Urethritis
Porphyrria		Glomerulonephritis	Polyps
Laxatives (phenolphthalein)		Interstitial nephritis	Foreign body
		Tuberculosis	Urethral stricture
		Infarct	
		Polycystic kidneys	
		Arteriovenous malformation	
		Exercise-induced	

### History

- if macroscopic, inquire about timing of hematuria in urinary stream
  - initial: anterior urethra
  - terminal: bladder neck and prostatic urethra
  - total: bladder and/or above

### Investigations

- CBC (r/o anemia, leukocytosis), electrolytes, Cr, BUN
- urine studies:
  - U/A, C&S, cytology
- imaging:
  - CT (with contrast) has largely replaced IVP to investigate upper tracts (U/S alone is not sufficient)
  - cystoscopy to investigate lower tract (possible retrograde pyelogram)

### Acute Management of Severe Bladder Hemorrhage

- manual irrigation via catheter with normal saline to remove clots
- CBI using large (22-26 Fr) 3-way Foley to help prevent clot formation
- cystoscopy if active bleeding:
  - identify resectable tumours
  - coagulate obvious sites of bleeding
- refractory bleeding:
  - continuous intravesical irrigation with 1% aluminum potassium sulfate solution as needed
  - intravesical instillation of 1% silver nitrate solution
  - intravesical instillation of 1-4% formalin (requires GA and pre-procedure cystogram to r/o reflux)
  - embolization or ligation of iliac arteries
  - cystectomy and diversion (rarely performed)

Gross, painless hematuria in adults is bladder cancer until proven otherwise.

**Common Urologic Causes of Hematuria Can Be Classified As:**

#### TICS

Trauma/Tumour/Toxins  
Infection/Inflammatory  
Calculi/Cysts  
Surgery/Sickle cell and other hematological causes

#### Upper Tract Imaging Options

##### Intravenous Pyelogram (IVP):

Traditional option but rarely used (replaced by CTU). Reasonable sensitivity for TCC, but poor sensitivity for RCC.

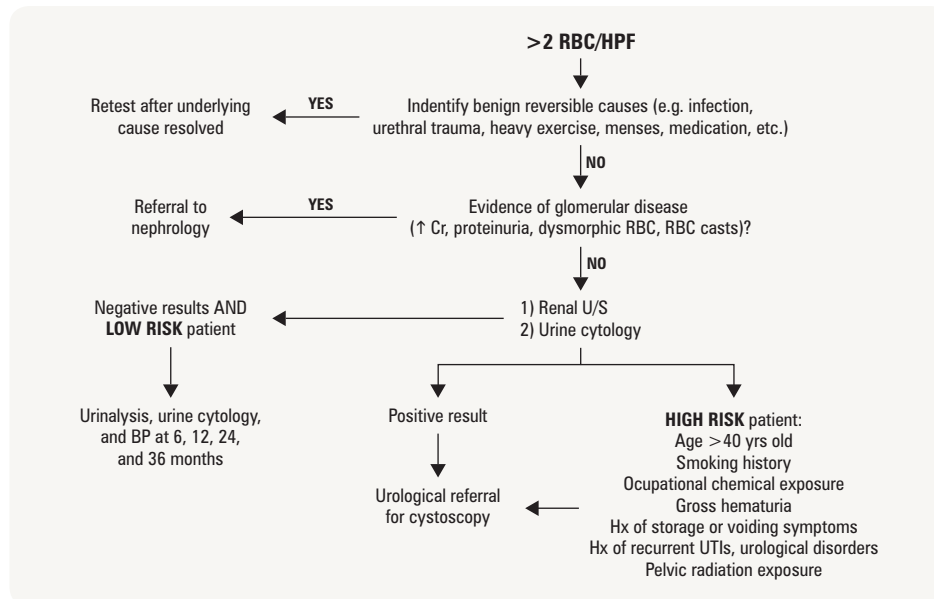

**U/S:** Superior to IVP for evaluation of renal parenchyma and renal cysts. Limited sensitivity for TCC and small renal masses. U/S alone is not sufficient for upper tract imaging.

**CT Urography (CTU):** Optimal test for renal parenchyma, calculi, and infections. Involves exposure to radiation and IV contrast. Assess kidney function prior to use of contrast.

## Microscopic Hematuria

### Definition

- >2 RBCs/HPF on urinalysis of two separate samples

**Figure 6. Workup of asymptomatic microscopic hematuria**

Based on CUA Guidelines. AUA recommends cystoscopy and CT urogram for all patients with confirmed microscopic hematuria; follow-up for negative work-up is urinalysis yearly for two years, with repeat anatomic evaluation if microscopic hematuria persists

## Dysuria

### Definition

- painful urination

### Etiology

**Table 3. Differential Diagnosis of Dysuria**

<b>Infectious</b>	Cystitis, urethritis, prostatitis, epididymitis/orchitis (if associated with lower tract inflammation), cervicitis, vulvovaginitis, perineal inflammation/infection, TB, vestibulitis
<b>Neoplasm</b>	Kidney, bladder, prostate, penis, vagina/vulva, BPH
<b>Calculi</b>	Bladder stone, ureteral stone, kidney stone
<b>Inflammatory</b>	Seronegative arthropathies (reactive arthritis: arthritis, uveitis, urethritis), drug side effects, autoimmune disorders, chronic pelvic pain syndrome (CPPS), interstitial cystitis
<b>Hormonal</b>	Endometriosis, hypoestrogenism
<b>Trauma</b>	Catheter insertion, post-coital cystitis (honeymoon cystitis)
<b>Psychogenic</b>	Somatization disorder, depression, stress/anxiety disorder
<b>Other</b>	Contact sensitivity, foreign body, radiation/chemical cystitis

### Investigations

- focused hx and P/E to determine cause (fever, D/C, conjunctivitis, CVA tenderness, back/joint pain)
  - any D/C (urethral, vaginal, cervical) should be sent for gonococcus/chlamydia testing; wet mount if vaginal D/C
  - U/A and urine C&S
  - if suspect infection, may start empiric ABx treatment (see Table 8 in *Infectious and Inflammatory Disease*, U11, for ABx)
  - ± imaging of urinary tract (tumour, stones)

## Hydronephrosis

### Definition

- dilation of the renal pelvis and calyces caused by the backward pressure of trapped urine

### Etiology

- mechanical:
  - congenital: see *Congenital Abnormalities*, U36
  - acquired:
    - intrinsic: trauma, inflammation and bleeding, calculi, urologic neoplasms, BPH, urethral stricture, phimosis
    - extrinsic: trauma, neoplasms (uterine fibroid; colorectal, uterine, and cervical malignancies; lymphoma), aortic aneurysm, pregnancy (gravid uterus)
- functional:
  - neurogenic: neurogenic bladder, diabetic neuropathy, spinal cord disease
  - pharmacologic: anticholinergics,  $\alpha$ -adrenergic agonists
  - hormonal: pregnancy (progesterone decreases ureteral tone)

### Investigations

- focused hx, inquiring about pain (flank, lower abdomen, testes, labia), U/O, medication use, pregnancy, trauma, fever, hx of UTIs, calculi and PID
- CBC, electrolytes, Cr, BUN, U/A, C&S
- imaging studies (U/S is >90% sensitive and specific)

### Treatment

- aimed at relieving the cause of obstruction/stasis
- urgent treatment is required if associated with infection, acute renal failure, or severe pain
  - percutaneous nephrostomy tube or ureteral stenting to relieve pressure

## Voiding Dysfunction

- see [Gynecology](#), GY34 for relevant female topics

## Voiding

- two phases of lower urinary tract function:
  - storage phase (bladder filling and urine storage):
    - accommodation and compliance
    - no involuntary contraction
  - voiding phase (bladder emptying):
    - coordinated detrusor contraction
    - synchronous relaxation of outlet sphincters
    - no anatomic obstruction
- voiding dysfunction can therefore be classified as:
  - failure to store: due to bladder or outlet
  - failure to void: due to bladder or outlet
- three types of symptoms
  - storage (formerly known as irritative)
  - voiding (formerly known as obstructive)
  - post-voiding

## Failure to Store: Urinary Incontinence

### Definition

- involuntary leakage of urine

### Etiology

- urgency incontinence:
  - detrusor overactivity:
    - CNS lesion, inflammation/infection (cystitis, stone, tumour), bladder neck obstruction (tumour, stone), BPH, idiopathic
  - decreased compliance of bladder wall:
    - CNS lesion, fibrosis
    - sphincter/urethral problem

#### Lower Urinary Tract Symptoms (LUTS)

##### Storage (FUND)

Frequency  
Urgency  
Nocturia  
Dysuria

##### Voiding (SHED)

Stream changes  
Hesitancy  
Incomplete Emptying  
Dribbling

- stress urinary incontinence (SUI):
  - common in women; seen in men after prostate cancer treatment or pelvic operations
  - urethral hypermobility:
    - ♦ weakened pelvic floor and musculofascial urethral and vaginal supporting mechanisms allows bladder neck and urethra to descend with increased intra-abdominal pressure
    - ♦ urethra is pulled open by greater motion of posterior wall of outlet relative to anterior wall
    - ♦ associated with childbirth, pelvic surgery, aging, levator muscle weakness
  - intrinsic sphincter deficiency (ISD): weakness of the urethra and associated smooth and striated muscle elements
    - ♦ pelvic surgery, neurologic problem, aging and hypoestrogen state
  - ISD and urethral hypermobility can co-exist
- mixed incontinence:
  - combination of stress and urgency incontinence
- overflow incontinence:
  - is a term sometimes used to describe urinary incontinence as a complication of urinary retention; for causes of urinary retention see *Failure to Void: Urinary Retention*, below
  - the International Continence Society no longer recommends the use of this term as it is confusing and lacks a clear definition; if the term is used it should be accompanied by the associated pathophysiology (e.g. BPH with overflow incontinence)

### Epidemiology

- variable prevalence in women: 25-45%
- F:M = 2:1
- more frequent in the elderly, affecting 5-15% of those living in the community and 50% of nursing home residents

**Table 4. Urinary Incontinence: Types and Treatments**

Type	Urgency	Stress	Mixed
<b>Definition</b>	Involuntary leakage of urine preceded by a strong, sudden urge to void	Involuntary leakage of urine with sudden increases in intra-abdominal pressure	Urinary leakage associated with urgency and increased intra-abdominal pressure
<b>Etiology</b>	Bladder (detrusor overactivity)	Urethra/sphincter weakness, post-partum pelvic musculature weakness	Combination of bladder and sphincter issues
<b>Diagnosis</b>	Hx Urodynamics	Hx Urodynamics Stress test (have patient bear down/cough)	Hx Stress test
<b>Therapy</b>	Anticholinergics Lifestyle changes (fluid alterations, diet, etc.) Bladder habit training Botulinum toxin Neuromodulation	Weight loss Kegel exercises Bulking agents Surgery (slings, tension-free vaginal tape, transobturator tape, artificial sphincters)	Combination of management of urge and stress incontinence

#### Causes of Reversible Urinary Incontinence

##### DIAPERS

Delirium

Inflammation/Infection

Atrophic vaginitis/urethritis

Pharmaceuticals/Psychological

Excess U/O

Restricted mobility/Retention

Stool impaction

Urgency is the symptom of a strong need to void. It is not necessarily associated with incontinence.

## Failure to Void: Urinary Retention

**Table 5. Etiology of Urinary Retention**

Outflow Obstruction	Bladder Innervation	Pharmacologic	Infection
<ul style="list-style-type: none"> <li>• Bladder neck or urethra: calculus, clot, foreign body, neoplasm, neurological (DSD)</li> <li>• Prostate: BPH, prostate cancer</li> <li>• Urethra: stricture, phimosis, traumatic disruption</li> <li>• Miscellaneous: constipation, pelvic mass</li> </ul>	<ul style="list-style-type: none"> <li>• Intracranial: CVA, tumour, Parkinson's, cerebral palsy</li> <li>• Spinal cord: injury, disc herniation, MS</li> <li>• DM</li> <li>• Post-abdominal or pelvic surgery</li> </ul>	<ul style="list-style-type: none"> <li>• Anticholinergics</li> <li>• Narcotics</li> <li>• Antihypertensives (ganglionic blockers, methyldopa)</li> <li>• OTC cold medications containing ephedrine or pseudoephedrine</li> <li>• Antihistamines</li> <li>• Psychosomatic substances (e.g. ecstasy)</li> </ul>	<ul style="list-style-type: none"> <li>• GU: UTI, prostatitis, abscess, genital herpes</li> <li>• Infected foreign body</li> <li>• Varicella zoster</li> </ul>

### Clinical Features

- suprapubic pain
- palpable and/or percussible bladder (suprapubic)
- possible purulent/bloody meatal D/C
- increased size of prostate or reduced anal sphincter tone on DRE
- neurological: presence of abnormal or absent deep tendon reflexes, reduced "anal wink", saddle anesthesia

#### Acute vs. Chronic Retention

Acute retention is a medical emergency characterized by pain and anuria with normal bladder volume and architecture. Acute overdistention can lead to bladder rupture.

Chronic retention can be asymptomatic with greatly increased bladder volume and detrusor hypertrophy followed by atony (late).

If a trauma patient is unable to void, has blood at urethral meatus, a scrotal hematoma, or a high riding prostate, there is urethral injury until proven otherwise so catheterization is CONTRAINDICATED unless performed by urology staff or resident.

## Investigations

- CBC, electrolytes, Cr, BUN, U/A and urine C&S, U/S, cystoscopy, urodynamic studies, PVR

## Treatment

- treat underlying cause
- catheterization:
  - acute retention
    - ♦ immediate catheterization to relieve retention; leave Foley in to drain bladder; F/U to determine cause; closely monitor fluid status and electrolytes (risk of POD)
  - chronic retention
    - ♦ intermittent catheterization by patient is commonly used; definitive treatment depends on etiology
- suprapubic tube placement
- for post-operative patients with retention:
  - encourage ambulation
  - $\alpha$ -blockers to relax bladder neck outlet
  - may need catheterization
  - definitive treatment will depend on etiology

Patients with ascites may have a falsely elevated PVR measured by bladder scan.

## Benign Prostatic Hyperplasia (BPH)

### Definition

- periurethral hyperplasia of stroma and epithelium in prostatic transition zone (see Figure 7)
- prostatic smooth muscle cells play a role in addition to hyperplasia

### Etiology

- etiology unknown
  - DHT required (converted from testosterone by 5- $\alpha$  reductase)
  - possible role of impaired apoptosis, estrogens, other growth factors

### Epidemiology

- age-related, extremely common (50% of 50 yr olds, 80% of 80 yr olds)
- 25% of men will require treatment

### Clinical Features

- result from outlet obstruction and compensatory changes in detrusor function
- voiding symptoms:
  - hesitancy, straining, weak/interrupted stream, incomplete bladder emptying
- storage symptoms:
  - urgency, frequency, nocturia, urgency incontinence
  - thought to be due to detrusor overactivity and/or decreased compliance
- DRE
  - prostate is smooth, rubbery and symmetrically enlarged
- complications:
  - retention
  - overflow incontinence
  - hydronephrosis
  - infection
  - gross hematuria
  - bladder stones

### Investigations

- hx, assessing LUTS and impact on QOL
  - may include self-administered questionnaires (IPSS or AUA symptom index for severity, progression, and treatment response)
- P/E, including DRE
- U/A to exclude UTI
- Cr  $\pm$  renal U/S to assess for hydronephrosis
- PSA to r/o malignancy (see *CaP Screening*, U25)
- uroflowmetry to measure flow rate (optional)
- PVR (optional)
- cystoscopy prior to potential surgical management
- biopsy if suspicious for malignancy

Figure 7. Cross-section of prostate

Prostate size does not correlate well with symptoms in BPH.

### Approximate Prostate Sizes

- 20 cc – chestnut
- 25 cc – plum
- 50 cc – lemon
- 75 cc – orange
- 100 cc – grapefruit

### AUA Prostate Symptom Score

#### FUNWISE

Frequency  
Urgency  
Nocturia  
Weak stream  
Intermittency  
Straining  
Emptying, incomplete feeling of

Each symptom graded out of 5  
0-7: Mildly symptomatic  
8-19: Moderately symptomatic  
20-35: Severely symptomatic

Note: dysuria not included in score but is commonly associated with BPH

## Treatment

**Table 6. Treatment of BPH**

	Conservative	Medical	Surgical	Minimally Invasive Surgical Therapies
<b>When to use</b>	All patients	Moderate to severe symptoms	Moderate to severe symptoms	Patients who wish to avoid or may not tolerate surgery
<b>Options</b>	<ul style="list-style-type: none"> <li>• Watchful waiting: 50% of patients improve spontaneously</li> <li>• Lifestyle modifications (e.g. evening fluid restriction, planned voiding)</li> </ul>	<ul style="list-style-type: none"> <li>• <math>\alpha</math>-adrenergic antagonists: reduce stromal smooth muscle tone</li> <li>• 5-<math>\alpha</math> reductase inhibitor: block conversion of testosterone to DHT; act to reduce prostate size</li> <li>• Combination is synergistic</li> <li>• Anti-cholinergic agents (for storage LUTS, without elevated PVR)</li> </ul>	<ul style="list-style-type: none"> <li>• TURP (see U42)</li> <li>• Laser ablation</li> <li>• TUIP (prostate &lt;30 g)</li> <li>• Open prostatectomy</li> </ul>	<ul style="list-style-type: none"> <li>• Microwave therapy</li> <li>• TUNA</li> <li>• Prostatic stent</li> </ul>

Men with planned cataract surgery should avoid starting  $\alpha$ -adrenergic antagonists until after their surgery due to the risk of intraoperative floppy iris syndrome.

**BPH Surgery**  
**Absolute Indication**

- Renal failure with obstructive uropathy
- Refractory urinary retention

**Relative Indications**

- Recurrent UTIs
- Recurrent hematuria refractory to medical treatment
- Renal insufficiency (r/o other causes)
- Bladder stones

## Urethral Stricture

### Definition

- decrease in urethral calibre due to scar formation in urethra (may also involve corpus spongiosum)
- M>F

### Etiology

- congenital
  - failure of normal canalization (technically not a stricture)
- trauma:
  - instrumentation/catheterization (most common)
  - external trauma (e.g. burns, straddle injury)
  - foreign body
- infection:
  - long-term indwelling catheter
  - STI
- inflammation:
  - balanitis xerotica obliterans (lichen sclerosis or chronic progressive sclerosing dermatosis of the male genitalia) causing meatal stenosis

### Clinical Features

- voiding symptoms
- urinary retention
- hydronephrosis
- related infections: recurrent UTI, secondary prostatitis/epididymitis

### Investigations

- laboratory findings
  - flow rates <10 mL/s (normal ~20 mL/s) on uroflowmetry
  - urine culture usually negative, but U/A may show pyuria
- radiologic findings
  - RUG and VCUG will demonstrate location
- cystoscopy

### Treatment

- urethral dilatation:
  - temporarily increases lumen size by breaking up scar tissue
  - healing will often reform scar tissue and recreate stricture
- visual internal urethrotomy (VIU):
  - endoscopically incise stricture
  - cure rate 50-80% with single treatment, <50% with repeated courses
- open surgical reconstruction:
  - complete stricture excision with anastomosis,  $\pm$  urethroplasty depending on location and size of stricture

**The Long-Term Effect of Doxazosin, Finasteride, and Combination Therapy on the Clinical Progression of Benign Prostatic Hyperplasia Medical Therapy of Prostatic Symptoms (MTOPS) Trial**

*NEJM* 2003;349:2387-2398

**Study:** Randomized, double-blinded, controlled trial with mean follow-up of 4.5 yr.

**Methods:** 3047 patients with symptomatic BPH were randomly assigned to placebo (n=737), doxazosin (n=756), finasteride (n=768), or combination therapy (n=786). Mean age 62.6. Interventions that were compared were conservative treatment vs. doxazosin vs. finasteride vs. combination therapy. Main outcomes were clinical progression defined as: first occurrence of an increase over base line of at least four points in the AUA symptom score, acute urinary retention, renal insufficiency, recurrent urinary tract infection, or urinary incontinence.

**Results:** The 6-yr absolute reduction in cumulative incidence of clinical progression of symptomatic BPH compared to placebo for doxazosin was 39% (P<0.001), finasteride was 34% (P=0.002), and combination therapy was 66% (P<0.001). Combination therapy was more effective than either doxazosin (P<0.001) or finasteride (P<0.001) alone. There was no significant difference between doxazosin and finasteride alone.

**Conclusion:** Long-term combination therapy with doxazosin and finasteride reduced the risk of overall clinical progression of benign prostatic hyperplasia significantly more than did treatment with either drug alone.

## Neurogenic Bladder

### Definition

- malfunctioning urinary bladder due to deficiency in some aspect of its innervation

### Neurophysiology

**Table 7. Efferent Sympathetic, Parasympathetic, and Somatic Nerve Supply**

Nerve Fibres	Nerve Roots	Neurotransmitter/Receptor	Target
Sympathetic T10-L2	T10-L2	NA/Adrenergic	Trigone, internal sphincter, proximal urethra Bladder body
Somatic (pudendal)	S2-4	ACh/Nicotinic	External sphincter
Parasympathetic	S2-4	ACh/Muscarinic (M2, M3)	Detrusor

- stretch receptors in the bladder wall relay information to PMC and activate micturition reflex (normally inhibited by cortical input)
  - micturition:
    - stimulation of parasympathetic neurons (bladder contraction)
    - inhibition of sympathetic and somatic neurons (internal and external sphincter relaxation, respectively)
  - urine storage:
    - opposite of micturition
- voluntary action of external sphincter (pudendal nerve roots S2-S4) can inhibit urge to urinate
- cerebellum, basal ganglia, thalamus, and hypothalamus all have input at PMC in the brainstem

### Classification of Neurologic Voiding Dysfunction

- neurogenic detrusor overactivity (formerly termed detrusor hyperreflexia):
  - lesion above PMC (e.g. stroke, tumour, MS, Parkinson's disease)
  - loss of voluntary inhibition of voiding
  - intact pathway inferior to PMC maintains coordination of bladder and sphincter
- detrusor sphincter dyssynergia (DSD):
  - lesion of spinal cord (e.g. trauma, MS, arteriovenous malformation, transverse myelitis)
  - loss of coordination between detrusor and sphincter (detrusor contracts on closed sphincter and vice versa)
  - component of detrusor overactivity as well
- detrusor atony/areflexia:
  - lesion of sacral cord or peripheral efferents (e.g. trauma, DM, disc herniation, MS, congenital spinal cord abnormality)
  - flaccid bladder which fails to contract
  - may progress to poorly compliant bladder with high pressures
- peripheral autonomic neuropathy:
  - deficient bladder sensation → increasing residual urine → decompensation (e.g. DM, neurosyphilis, herpes zoster)
- muscular lesion:
  - can involve detrusor, smooth/striated sphincter

### Neuro-Urologic Evaluation

- hx and P/E (urologic and general neurologic)
- U/A, renal profile
- imaging
  - IVP (less used), U/S to r/o hydronephrosis and stones
- cystoscopy
- urodynamic studies:
  - uroflowmetry to assess flow rate, pattern
  - filling CMG to assess capacity, compliance, detrusor overactivity
  - voiding CMG (pressure-flow study) to assess bladder contractility and extent of bladder outflow obstruction
  - video study to visualize bladder/bladder neck/urethra during CMG using x-ray contrast
  - EMG ascertains presence of coordinated or uncoordinated voiding, allows accurate diagnosis of DSD

### Treatment

- goals of treatment:
  - prevent renal failure
  - prevent infections
  - achieve social continence

#### 4Cs of Bladder

Capacity: 350-500 cc;  
 peds: (age in yrs + 2) x 30  
 Compliance: minimal  
 $\Delta$  Pressure/ $\Delta$  Volume  
 Contractility: voluntary and sustained  
 Cooperation: of bladder and sphincter

Nerve roots in micturition:

**"S2-3-4 keeps the urine off the floor."**

**"Spinal shock"**, initially manifests as atonic bladder.

- treatment options depend on status of bladder and urethra
  - bladder hyperactivity → medications to relax bladder (see *Urinary Incontinence*, U6)
    - ♦ if refractory:
      - botulinum toxin injections into bladder wall
      - occasionally augmentation cystoplasty (enlarging bladder volume and improving compliance by grafting section of detubularized bowel onto the bladder)
      - occasionally urinary diversion (ileal conduit or continent diversion) if bladder management unsuccessful
  - flaccid bladder → CIC

## Autonomic Dysreflexia

- occurs in patients with spinal cord injury above T6/T7
- exaggerated sympathetic nervous system response to visceral stimulation below the lesion
  - stimulation includes instrumentation or distension of bladder, urethra, or rectum
- symptoms include HTN, headache, reflex bradycardia, sweating, anxiety, piloerection
  - vasoconstriction below lesion, vasodilation above lesion
- treatment: removal of noxious stimuli, parenteral ganglionic or  $\alpha$ -blockers, nifedipine (prophylaxis during cystoscopy)

## Post-Obstructive Diuresis (POD)

### Definition

- polyuria resulting from relief of severe chronic obstruction
- $>3$  L/24 h or  $>200$  cc/h over each of two consecutive hours

### Pathophysiology

- **physiologic POD** secondary to excretion of retained urea,  $\text{Na}^+$ , and  $\text{H}_2\text{O}$  (high osmotic load) after relief of obstruction
  - self-limiting; usually resolves in 48 h with PO fluids but may persist to pathologic POD
- **pathologic POD** is a  $\text{Na}^+$ -wasting nephropathy secondary to impaired concentrating ability of the renal tubules due to:
  - decreased reabsorption of  $\text{NaCl}$  in the thick ascending limb and urea in the collecting tubule
  - increased medullary blood flow (solute washout)
  - increased flow and solute concentration in the distal nephrons

### Management

- admit patient and closely monitor hemodynamic status and electrolytes ( $\text{Na}^+$  and  $\text{K}^+$  q6-12h and replace prn; follow Cr and BUN to baseline)
- monitor U/O q2h and ensure total fluid intake  $<$ U/O by replacing every 1 cc U/O with 0.5 cc 1/2 NS IV (PO fluids if physiologic POD)
- avoid glucose-containing fluid replacement (iatrogenic diuresis)

## Infectious and Inflammatory Diseases

Table 8. Antibiotic Treatment of Urological Infections

Condition	Drug	Duration
Urethritis	non-gonococcal:	
	azithromycin (1 g PO)	x 1
	OR	
	doxycycline (100 mg PO bid)	7 d
	gonococcal:	
	ceftriaxone (250 mg IM) AND treat for <i>Chlamydia trachomatis</i>	x 1
Simple, Uncomplicated UTI	TMP-SMX (160 mg/800 mg PO bid)	3 d
	OR	
	nitrofurantoin (100 mg PO bid)	5 d
Complicated UTI (see <i>Classification</i> for features)	ciprofloxacin (1 g PO daily OR 400 mg IV q12h)	up to 2-3 wk
	OR	
	ampicillin (1 g IV q6h) + gentamicin (1 mg/kg IV q8h)	up to 2-3 wk
	OR	
	ceftriaxone (1-2 g IV q24h)	up to 2-3 wk
Recurrent/Chronic Cystitis	*prophylactic treatment	
	continuous: TMP-SMX (40 mg/200 mg PO qd OR 3x/wk)	6-12 mo
	post-coital: TMP-SMX (40 mg/200 mg-80 mg/400 mg)	within 2 h of coitus

Uncomplicated UTI in men  $<50$  should be treated with 7 d courses of TMP-SMX.

**Table 8. Antibiotic Treatment of Urological Infections** (continued)

Condition	Drug	Duration
<b>Acute Prostatitis</b>	ciprofloxacin (500-750 mg PO bid)	2-4 wk
	OR	
	TMP-SMX (160 mg/800 mg PO bid)	4 wk
	OR	
	IV therapy with gentamicin and ampicillin, penicillin w/ $\beta$ -lactamase inhibitor, 3 <sup>rd</sup> gen cephalosporin, OR a fluoroquinolone	4 wk total (IV and oral step-down)
<b>Chronic Prostatitis</b>	ciprofloxacin (500 mg PO bid)	4-6 wk
<b>Epididymitis/Orchitis</b>	<35 yr:	
	ceftriaxone (200 mg IM)	x 1
	AND	
	doxycycline (100 mg PO bid)	10 d
	$\geq 35$ yr:	
	ofloxacin (300 mg PO bid)	10 d
<b>Acute Uncomplicated Pyelonephritis</b>	ciprofloxacin (500 mg PO bid)	7 d
	$\pm$ ceftriaxone (1 g IV) OR ciprofloxacin (400 mg IV)	x 1
	OR	
	IV therapy with a fluoroquinolone, gentamicin and ampicillin, extended spectrum cephalosporin, extended spectrum penicillin, OR a carbapenem	14 d total (IV and oral step-down)

Antibiotic therapy should always be based on local resistance patterns and adjusted according to culture and sensitivity results.

IV antibiotics should be stepped down to oral when the patient is afebrile and clinically stable.

Acute uncomplicated pyelonephritis: suspected or confirmed enterococcus infection requires treatment with ampicillin.

## Urinary Tract Infection (UTI)

- for UTIs during pregnancy, see [Obstetrics](#), OB20

### Definition

- symptoms suggestive of UTI (see *Clinical Features* below) + evidence of pyuria and bacteriuria on U/A or urine C&S
  - if asymptomatic + 100,000 CFU/mL = asymptomatic bacteriuria; only requires treatment in certain patients (e.g. pregnancy)

### Classification

- uncomplicated: lower UTI in a setting of functionally and structurally normal urinary tract
- complicated: structural and/or functional abnormality, immunocompromised, iatrogenic complication, pregnancy, pyelonephritis, catheter-associated
- recurrent: see *Recurrent/Chronic Cystitis*, U13

### Risk Factors

- stasis and obstruction:
  - residual urine due to impaired urine flow e.g. PUVs, reflux, medication, BPH, urethral stricture, cystocele, neurogenic bladder
- foreign body:
  - introduce pathogen or act as nidus of infection e.g. catheter, instrumentation
- decreased resistance to organisms:
  - DM, malignancy, immunosuppression, spermicide use, estrogen depletion, antimicrobial use
- other factors:
  - trauma, anatomic abnormalities, female, sexual activity, fecal incontinence

### Clinical Features

- storage symptoms: frequency, urgency, dysuria
- voiding symptoms: hesitancy, post-void dribbling
- other: suprapubic pain, hematuria, foul-smelling urine
- pyelonephritis – if present: typically presents with more severe symptoms (e.g. fever/chills, CVA tenderness, flank pain)

### Organisms

- typical organisms (see sidebar)
- atypical organisms:
  - tuberculosis (TB)
  - Chlamydia trachomatis*
  - Mycoplasma (*Ureaplasma urealyticum*)
  - fungi (*Candida*)

### Indications for Investigations

- pyelonephritis
- persistence of pyuria/symptoms following adequate therapy
- severe infection with an increase in Cr
- recurrent/persistent infections
- atypical pathogens (urea splitting organisms)
- hx of structural abnormalities/decreased flow

#### Cystitis: Common Pathogens

##### KEEPS

*Klebsiella* sp.  
*E. coli* (90%), other Gram-negatives  
*Enterococci*  
*Proteus mirabilis*, *Pseudomonas*  
*S. saprophyticus*

**Investigations**

- U/A, urine C&S
  - UA: leukocytes  $\pm$  nitrites  $\pm$  hematuria
  - C&S: midstream, catheterized, or suprapubic aspirate
- if hematuria present, retest post-treatment, if persistent need hematuria workup (see *Microscopic Hematuria*, U5)
- CT scan if indicated

**Treatment**

- see Table 8 for approach to ABx therapy
- if febrile, consider admission with IV therapy and r/o obstruction

## Recurrent/Chronic Cystitis

**Definition**

- $\geq 3$  UTIs/12 mo

**Etiology**

- bacterial reinfection (80%) vs bacterial persistence (relapse)
  - **bacterial reinfection:**
    - ♦ recurrence of infection with either 1) a different organism, 2) the same organism if cultured  $>2$  wk following therapy, or 3) with any organism with an intermittent sterile culture
  - **bacterial persistence:**
    - ♦ same organism cultured within 2 wk of sensitivity-based therapy

**Investigations**

- assess predisposing factors as described above
- investigations may include cystoscopy, U/S, CT

**Treatment**

- lifestyle changes (limit caffeine intake, increase fluid/H<sub>2</sub>O intake)
- ABx: continuous vs. post-coital (see Table 8)
- post-menopausal women: consider topical or systemic estrogen therapy
- no treatment for asymptomatic bacteriuria except in pregnant women or patients undergoing urinary tract instrumentation

**Prevention of UTIs**

- Maintain good hydration (especially with cranberry juice)
- Wipe from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

## Interstitial Cystitis (Painful Bladder or Bladder Pain Syndrome)

**Definition**

- chronic urgency, frequency  $\pm$  pain without other reasonable causation

**Classification**

- non-ulcerative (more common)
- ulcerative

**Etiology**

- unknown
  - theories: increased epithelial permeability, autoimmune, neurogenic, defective glycosaminoglycan (GAG) layer overlying mucosa
  - associations: severe allergies, IBS, fibromyalgia

**Epidemiology**

- prevalence: 20/100,000
- 90% of cases are in females
- mean age at onset is 40 yr (non-ulcerative tends to affect a younger to middle-aged population, while ulcerative tends to be seen in middle-aged to older)

**Clinical Features**

- pain associated with the bladder
- glomerulations (submucosal petechiae) or Hunner's ulcers on cystoscopic examination
- urinary urgency
- negative U/A, urine C&S, and urine cytology

**Differential Diagnosis**

- UTI, vaginitis, bladder tumour
- radiation/chemical cystitis
- eosinophilic/TB cystitis
- bladder calculi

Cystoscopic evaluation is not necessary to make a diagnosis.

**Treatment**

- first-line: patient empowerment (diet, lifestyle, stress management), pain management
- second-line:
  - oral: pentosan polysulfate sodium, amitriptyline, cimetidine, hydroxyzine
  - intravesical: dimethylsulfoxide (DMSO), heparin, lidocaine
- third-line: cystoscopy with bladder hydrodistention (traditionally diagnostic) under GA, treat Hunner's ulcers if present
- other: neuromodulation, cyclosporine A, intradetrusor botulinum toxin
- surgery (last resort): augmentation cystoplasty, or urinary diversion ± cystectomy

Four symptom scores exist to evaluate and monitor patients with interstitial cystitis:

- Interstitial Cystitis Symptom Index (ICSI)
- Interstitial Cystitis Problem Index (ICPI)
- Wisconsin Interstitial Cystitis (UW-IC) Scale
- Pain, Urgency and Frequency (PUF) Score

## Acute Pyelonephritis

**Definition**

- infection of the renal parenchyma with local and systemic manifestations

**Etiology**

- ascending (usually GN bacilli) or hematogenous route (usually GP cocci)
- causative microorganisms:
  - gram positives: *Enterococcus faecalis*, *S. aureus*, *S. saprophyticus*
  - gram negatives: *E. coli* (most common), *Klebsiella*, *Proteus*, *Pseudomonas*, *Enterobacter*
- common underlying causes of pyelonephritis
  - stones, strictures, prostatic obstruction, vesicoureteric reflux, neurogenic bladder, catheters, DM, sickle-cell disease, PCKD, immunosuppression, post-renal transplant, instrumentation, pregnancy

**Clinical Features**

- rapid onset (<24 h)
- LUTS including frequency, urgency, hematuria; NOT dysuria unless concurrent cystitis
- fever, chills, nausea, vomiting, myalgia, malaise
- CVA tenderness or exquisite flank pain

**Investigations**

- U/A, urine C&S
- CBC and differential: leukocytosis, left shift
- imaging indicated if suspicious of complicated pyelonephritis or symptoms do not improve with 48-72 h of treatment
  - abdominal/pelvic U/S
  - CT
- nuclear medicine: DMSA scan can be used to help secure the diagnosis
  - a photopenic defect indicates active infection or scar; if normal alternative diagnoses should be considered

**Treatment**

- hemodynamically stable:
  - outpatient oral ABx treatment ± single initial IV dose (see Table 8)
- severe or non-resolving:
  - admit, hydrate, and treat with IV ABx (see Table 8)
- emphysematous pyelonephritis:
  - consider emergent nephrectomy after IV ABx started and patient stabilized
- renal obstruction:
  - admit for emergent stenting or percutaneous nephrostomy tube

Nitrofurantoin has poor tissue penetration and therefore is not used to treat pyelonephritis (requires post-renal uroconcentration).

## Prostatitis/Prostatodynia

**Epidemiology**

- most common urologic diagnosis in men <50 yr
- prevalence 2-12%

**4-Glass Test:** Prostatic source is suggested when colony counts in EPS and VB3 exceed those of VB1 and VB2 by 10x.

Prostatic massage may cause extreme tenderness and increased risk of inducing sepsis, abscess, or epididymo-orchitis.

It is not recommended to do a serum PSA during acute bacterial prostatitis.

## Classification

**Table 9. Comparison of the Three Types of Prostatitis**

	Category I: Acute Bacterial Prostatitis	Category II: Chronic Bacterial Prostatitis	Category III: Chronic Pelvic Pain Syndrome (CPPS) (Abacterial)
<b>Etiology</b>	Ascending urethral infection with KEEPS (see U12 sidebar): 80% <i>E. coli</i> Often associated with outlet obstruction, recent cystoscopy, prostatic biopsy Most infections occur in the peripheral zone (see Figure 7)	Recurrent exacerbations of acute prostatitis-like signs and symptoms Recurrent UTI with same organism	Divided into inflammatory (IIIA) and non-inflammatory (IIIB) Intraprostatic reflux of urine $\pm$ urethral hypertonia Multifactorial (immunological, neuropathic, neuroendocrine, psychosocial)
<b>Clinical Features</b>	Acute onset fever, chills, malaise Rectal, lower back and perineal pain LUTS	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain
<b>Investigations</b>	PEx: Abdo, external genitalia, perineum, prostate U/A Blood CBC, C&S Transrectal U/S if non-resolving/suspect prostatic abscess	PEx: as per Category I + pelvic floor Urine C&S: 4-glass test VB1 (voided bladder): initial (urethra) VB2: midstream (bladder) EPS (expressed prostatic secretions): not usually performed VB3: post-massage/DRE	Same as per Category II NIH-CPSI score* Consider psychological assessment
<b>Treatment</b>	Supportive measures PO or IV ABx depending how sick (see Table 8) May consider catheterization in pts with severe obstructive LUTS or retention I&D of abscess if present	ABx (see Table 8) Consider addition of an $\alpha$ -blocker	Supportive measures Trial of ABx therapy if newly diagnosed Multi-modal Tx strategy may include: $\alpha$ -blocker Anti-inflammatories Phytotherapy (quercetin, cernilton)

\*NIH-CPSI: National Institute of Health Chronic Prostatitis Symptom Index

## Epididymitis and Orchitis

### Etiology

- common infectious causes:
  - <35 yr: *N. gonorrhoeae* or *Chlamydia trachomatis*
  - $\geq 35$  yr or penetrative anal intercourse: GI organisms (especially *E. coli*)
- other causes:
  - mumps infection may involve orchitis, post-parotitis
  - TB
  - syphilis
  - granulomatous (autoimmune) in elderly men
  - amiodarone (involves only head of epididymis)

### Risk Factors

- UTI
- unprotected sexual contact
- instrumentation/catheterization
- reflux
- increased pressure in prostatic urethra (straining, voiding, heavy lifting) may cause reflux of urine along vas deferens  $\rightarrow$  sterile epididymitis
- immunocompromise

### Clinical Features

- sudden onset scrotal pain and swelling  $\pm$  radiation along cord to flank
- scrotal erythema and tenderness
- fever
- storage symptoms, purulent D/C
- reactive hydrocele

### Investigations

- U/A, urine C&S
- $\pm$  urethral D/C: Gram stain/culture
- if diagnosis uncertain, must do:
  - colour-flow Doppler U/S to r/o testicular torsion

### Treatment

- r/o torsion (see *Investigations* and Table 23, U28)
- see Table 8 for ABx therapy
- scrotal support, bed rest, ice, analgesia

### Complications

- if severe  $\rightarrow$  testicular atrophy
- 30% have persistent infertility problems

**Prehn's sign:** pain may be relieved with elevation of testicles in epididymitis but not in testicular torsion. Poor sensitivity, especially in children.

If unsure between diagnoses of epididymitis and torsion, always go to OR.

Remember: torsion > 6 h has poor prognosis

Inadequately treated acute epididymitis may lead to chronic epididymitis or epididymo-orchitis.

## Urethritis

### Etiology

- infectious or inflammatory (e.g. reactive arthritis)

**Table 10. Infectious Urethritis: Gonococcal vs. Non-Gonococcal**

	Gonococcal	Non-gonococcal
<b>Causative organism</b>	<i>Neisseria gonorrhoeae</i>	Usually <i>Chlamydia trachomatis</i>
<b>Diagnosis</b>	Hx of sexual contact, thick, profuse, yellow-grey purulent D/C, LUTS Gram stain (GN diplococci), urine PCR and/or culture from urethral specimen	Hx of sexual contact, mucoid whitish purulent, D/C, $\pm$ storage LUTS Gram stain demonstrates $>4$ PMN/oil immersion field, no evidence of <i>N. gonorrhoeae</i> , urine PCR and/or culture from urethral specimen
<b>Treatment</b>	see Table 8	see Table 8

If culture negative or unresponsive to treatment consider: *Ureaplasma urealyticum*, *Mycoplasma genitalium*, *Trichomonas vaginalis*, HSV, or adenovirus.

**Reactive Arthritis (formerly known as Reiter's syndrome)**  
Urethritis, uveitis and arthritis (can't pee, can't see, can't climb a tree)

## Stone Disease

### Epidemiology

- prevalance of 2-3%
- male:female = 3:1
- peak incidence 30-50 yr of age
- recurrence rate: 10% at one yr, 50% at 5 yr, 60-80% lifetime

### Risk Factors

- hereditary: RTA, G6PD, cystinuria, xanthinuria, oxaluria, etc.
- lifestyle: minimal fluid intake; excess vitamin C, oxalate, purines, calcium
- medications: loop diuretics (furosemide, bumetanide), acetazolamide, topiramate, and zonisamide
- medical conditions: UTI (with urea-splitting organisms), myeloproliferative disorders, IBD, gout, DM, hypercalcemia disorders (hyperparathyroidism, tumour lysis syndrome, sarcoidosis, histoplasmosis), obesity (BMI  $>30$ )

### Clinical Features

- urinary obstruction  $\rightarrow$  upstream distention  $\rightarrow$  pain
  - flank pain from renal capsular distention (non-colicky)
  - severe waxing and waning pain radiating from flank to groin, testis, or tip of penis due to stretching of collecting system or ureter (ureteral colic)
- writhing, never comfortable, nausea, vomiting, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- bladder stones result in: storage and voiding LUTS, terminal hematuria, suprapubic pain
- if fever, r/o concurrent pyelonephritis and/or obstruction

**Table 11. Differential Diagnosis of Renal Colic**

GU	Abdominal	Neurological
<ul style="list-style-type: none"> <li>Pyelonephritis</li> <li>Ureteral obstruction from other cause: UPJ obstruction, clot colic secondary to gross hematuria, sloughed papillae</li> <li>Gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, PID</li> </ul>	<ul style="list-style-type: none"> <li>AAA</li> <li>Bowel ischemia</li> <li>Pancreatitis</li> <li>Other acute abdominal crisis</li> </ul>	<ul style="list-style-type: none"> <li>Radiculitis (L1): herpes zoster, nerve root compression</li> </ul>

### Location of Stones

- calyx: may cause flank discomfort, persistent infection, persistent hematuria, or remain asymptomatic
- pelvis: tend to cause obstruction at UPJ, may cause persistent infection
- ureter:  $<5$  mm diameter will pass spontaneously in 75% of patients

### Stone Pathogenesis

- supersaturation of stone constituents (at appropriate temperature and pH)
- stasis, low flow, and low volume of urine (dehydration)
- crystal formation and stone nidus
- loss of inhibitory factors:
  - citrate (forms soluble complex with calcium)
  - magnesium (forms soluble complex with oxalate)
  - pyrophosphate
  - Tamm-Horsfall glycoprotein

#### Key Points in Stone Hx

- Diet (especially FLUID INTAKE)
- Predisposing medical conditions
- Predisposing medications
- Previous episodes/investigations/treatments
- Family hx (1st degree relative)

The four narrowest passage points for upper tract stones are:

- UPJ
- Pelvic brim
- Under vas deferens/broad ligament
- UVJ

	Radiopaque	Radiolucent
<b>KUB</b>	Calcium Struvite Cystine	Uric acid Indinavir
<b>CT</b>	Calcium Struvite Cystine Uric acid	Indinavir

## Approach to Renal Stone

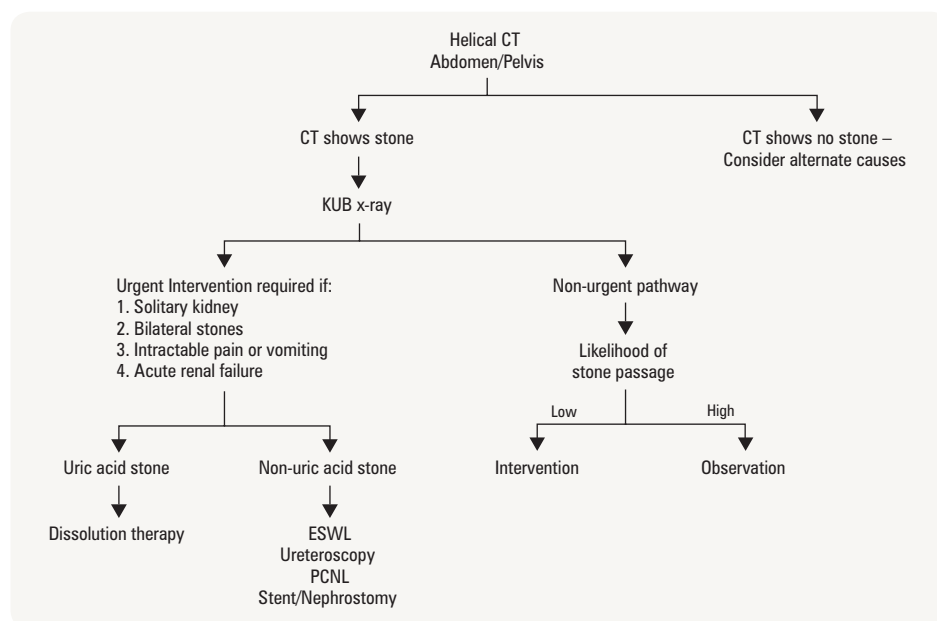

Figure 8. Approach to renal stone

### Investigations

Table 12. Investigations for Renal Stones

	CBC, uric acid, U/A, urine C&S	KUB x-ray	CT scan	Abdominal ultrasound	Cystoscopy	PTH, 24 h urine x 2 for volume, Cr, Ca <sup>2+</sup> , Na <sup>+</sup> , PO <sub>4</sub> <sup>3-</sup> , Mg <sup>2+</sup> , oxalate, citrate, ± cystine
<b>Who gets it?</b>	Everyone	Most	First episode renal colic	Pediatric cases or those concerning for obstruction	± Those concerning for bladder stone	Recurrent Ca <sup>2+</sup> stone formers ± pediatric cases
<b>Why is it done?</b>	May show signs of infection, ± sensitivities	90% of stones are radiopaque Good for follow-up	Distinguish radiolucent stone from soft tissue filling defect X-ray comparison	No radiation Visualize hydronephrosis	Visualize bladder	Need to rule out metabolic cause for stones
<b>Cautions</b>	–	Do not mistake phleboliths for stones!	Radiation Must be a non-contrast scan	Not good at visualizing stones in ureter	–	–

### Treatment – Acute

- medical
  - analgesic ± antiemetic
  - NSAIDs help lower intra-ureteral pressure
  - medical expulsion therapy (MET)
    - ♦ α-blockers: increase rate of spontaneous passage in distal ureteral stones
    - ♦ calcium channel blockers
  - ± Abx for bacteriuria
  - IV fluids if vomiting (note: IV fluids do NOT promote stone passage)
- interventional:
  - required if obstruction endangers patient, e.g. sepsis, renal failure
  - first line: ureteric stent (via cystoscopy)
  - second line: image-guided percutaneous nephrostomy
- admit if necessary:
  - see sidebar: *Indications for Admission to Hospital*

### Treatment – Elective

- medical:
  - likely conservative if ureteral stone <10 mm or kidney stone <5 mm and no complications/symptoms well controlled
    - ♦ stones <5 mm especially likely to pass spontaneously
  - PO fluids to increase urine volume to >2 L/d (3-4 L if cystine) and MET
  - specific to stone type (see Table 13)
  - periodic imaging to monitor stone position and assess for hydronephrosis
  - progress to interventional stone removal methods if symptoms worsen or fail to improve (indicating stone passage)

Detailed metabolic studies are NOT recommended unless complex patient (recurrent stone formers, pregnancy, pediatrics, strong family hx, underlying kidney or systemic disease, etc).

24 h urine collections must be done AFTER discontinuing stone preventing/promoting medications.

#### Indications for Admission to Hospital:

- Intractable pain
- Intractable vomiting
- Fever (suggests infection)
- Compromised renal function (including single kidney, bilateral obstructing stone)
- Pregnancy

#### Stones and Infection

If septic, urgent decompression via ureteric stent or percutaneous nephrostomy is indicated. Definitive treatment of the stone should be delayed until the sepsis has cleared.

#### Efficacy of α-Blockers for the Treatment of Ureteral Stones

*J. Urol* 2007;177:983-987  
**Study:** Meta-analysis of prospective randomized trials comparing α-blockers to conservative therapy.  
**Methods:** MEDLINE, the Cochrane Central Search library, EMBASE, and the electronic database of abstracts presented at the Annual Meeting of the American Urological Association were searched for literature published in English. 11 studies met selection criteria (n=911). Treatment ranged from 8 d-6 wk. Outcome of interest was incidence of distal ureteral stone expulsion.  
**Results:** Administration of an α-blocker with conservative treatment increased incidence of stone expulsion over conservative treatment alone by 44% (95% CI 1.31-1.59, p<0.001).  
**Conclusion:** α-blocker therapy is associated with significantly increased rates of distal ureteral stone expulsion.

Although hypercalciuria is a risk factor for stone formation, decreasing dietary calcium is NOT recommended to prevent stone formation. Low dietary calcium leads to increased GI oxalate absorption and higher urine levels of calcium oxalate.

- interventional:
  - kidney
    - ♦ may stent prior to ESWL if stone is 1.5-2.5 cm
    - ♦ ESWL if stone <2 cm
    - ♦ PCNL if stone >2 cm (see sidebar)
  - ureteral stones >10 mm
    - ♦ ESWL and URS are both first line treatment modalities for all locations
      - URS has significantly greater stone-free rates for stones at all locations in ureter, but also has higher complication rates (ureter perforation, stricture formation, etc.)
    - ♦ PCNL is second line treatment
    - ♦ laparoscopic or open stone removal (very rare)
  - bladder
    - ♦ transurethral stone removal or cystolitholapaxy
    - ♦ remove outflow obstruction (TURP or stricture dilatation)

**Indications for PCNL**

- Size > 2 cm
- Staghorn
- UPJ obstruction
- Calyceal diverticulum
- Cystine stones (poorly fragmented with ESWL)
- Anatomical abnormalities
- Failure of less invasive modalities

**Prevention**

- dietary modification:
  - increase fluid (>2 L/d), K<sup>+</sup> intake
  - reduce animal protein, oxalate, Na<sup>+</sup>, sucrose, and fructose intake
  - avoid high-dose vitamin C supplements
- medications:
  - thiazide diuretics for hypercalciuria
  - allopurinol for hyperuricosuria
  - potassium citrate for hypocitraturia, hyperuricosuria

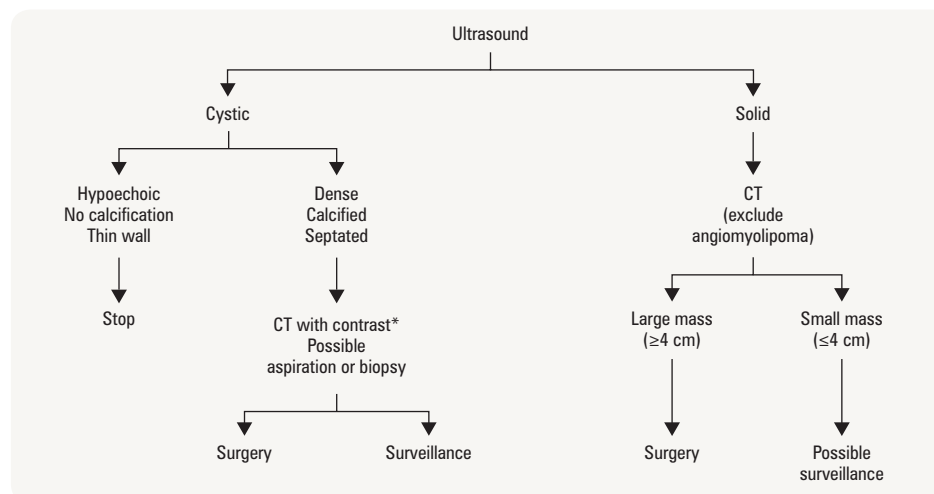

Consideration must be given to monitoring stone formers with periodic imaging (i.e. at year 1 and then q2-4yr based on likelihood of recurrence).

**Table 13. Stone Classification**

Type of Stone	Calcium (75-85%)	Uric Acid (5-10%)	Struvite (5-10%)	Cystine (1%)
<b>Etiology</b>	Hypercalciuria Hyperuricosuria (25% of patients with Ca <sup>2+</sup> stones) Hyperoxaluria (<5% of patients) Hypocitraturia (12% of patients) Other causes: • Hypomagnesemia – associated with hyperoxaluria and hypocitraturia • High dietary Na <sup>+</sup> • Decreased urinary proteins • High urinary pH, low urine volume (e.g. GI water loss) • Hyperparathyroidism, obesity, gout, DM	Uric acid precipitates in low volume, acidic urine with a high uric acid concentration: • Hyperuricosuria alone • Low urinary pH, low urine volume (e.g. GI water loss) • Drugs (ASA, thiazides) • Diet (purine rich red meats) • Hyperuricosuria with hyperuricemia • Gout • High rate of cell turnover or cell death (leukemia, cytotoxic drugs)	Infection with urea-splitting organisms ( <i>Proteus</i> , <i>Pseudomonas</i> , <i>Providencia</i> , <i>Klebsiella</i> , <i>Mycoplasma</i> , <i>Serratia</i> , <i>S. aureus</i> ) results in alkaline urinary pH and precipitation of struvite (magnesium ammonium phosphate)	Autosomal recessive defect in small bowel mucosal absorption and renal tubular absorption of dibasic amino acids results in “COLA” in urine (cystine, ornithine, lysine, arginine)
<b>Key Features</b>	Radiopaque on KUB Reducing dietary Ca <sup>2+</sup> is NOT an effective method of prevention/treatment	Radiolucent on KUB Radiopaque on CT Acidic urine, pH < 5.5 (NOT necessarily elevated urinary uric acid)	Perpetuates UTI because stone itself harbours organism Stone and all foreign bodies must be cleared to avoid recurrence Associated with staghorn calculi Positive urine dip and cultures Note: <i>E. coli</i> infection does not cause struvite stones 3:1 (M:F), UTI more common in female	Aggressive stone disease seen in children and young adults Recurrent stone formation, family hx Often staghorn calculi Faintly radiopaque on KUB Positive urine sodium nitroprusside test, urine chromatography for cystine
<b>Treatment</b> Medical if stone <5 mm and no complications  Procedural/Surgical treatment if stone >5 mm or presence of complications (see U17 for treatment)	Fluids to increase urine volume to >2 L/d For calcium stones: cellulose phosphate, orthophosphate for absorptive causes Calcium oxalate: thiazides, ± potassium citrate, ± allopurinol Calcium struvite: ABx (stone must be removed to treat infection)	Increased fluid intake Alkalinization of urine to pH 6.5 to 7 (bicarbonate, potassium citrate) ± allopurinol	Complete stone clearance ABx for 6 wk Regular F/U urine cultures	Increased fluid intake (3-4 L of urine/d) Alkalinize urine (bicarbonate, potassium citrate), Penicillamine/α-MPG or Captopril (form complex with cystine) ESWL not effective

# Urological Neoplasms

## Approach to Renal Mass

**Figure 9. Workup of a renal mass**

\*Imaging modality may be different in cases of contrast allergy or elevated creatinine

There is controversy over optimal management of small renal masses.

## Benign Renal Neoplasms

### CYSTIC KIDNEY DISEASE

- **simple cysts:** usually solitary or unilateral
  - very common: up to 50% at age 50
  - usually incidental finding on abdominal imaging
  - **Bosniak Classification** is used to stratify for risk of malignancy based on cyst features from contrast CT (see Table 14)
- **polycystic kidney disease**
  - autosomal recessive: multiple bilateral cysts, often leading to early renal failure in infants
  - autosomal dominant: progressive bilateral disease leading to HTN and renal failure
- **medullary sponge kidney:** cystic dilatation of the collecting ducts
  - usually benign course, but patients are predisposed to stone disease
- **von Hippel-Lindau syndrome:** multiple bilateral cysts or clear cell carcinomas (50% incidence of RCC)
  - renal cysts, cerebellar, spinal and retinal hemangioblastomas, pancreatic and epididymal cysts, pheochromocytomas

#### Tuberous Sclerosis

Syndrome characterized by mental retardation, epilepsy, and adenoma sebaceum. 45-80% of patients also present with angiomyolipomas which are often multiple and bilateral.

Percutaneous needle biopsies of cystic renal masses may lead to peritoneal seeding.

**Table 14. Bosniak Classification of Renal Cysts**

Class	Description	Features	Risk of Malignancy	Management Plan
I	Simple cyst	Round, no septations, no calcifications, no solid component	Near zero	F/U usually not required
II	Simple cyst	A few thin septa, no true enhancement, well-marginated, uniform high attenuation, <3 cm	Minimal	F/U usually not required
IIIF	Minimally complex cyst with extra features that require F/U	Still well-marginated and non-enhancing, but now multiple thin septa or some thickening/calcification of septa/wall, >3 cm	5-20%	Requires F/U with imaging q6-12 mo If the lesion evolves, may require surgical resection
III	Complex cyst	Thicker or more irregular walls with measurable enhancement	>50%	Requires surgical resection
IV	Clearly malignant	Class III + enhancing soft-tissue components	>90%	Requires surgical resection

Table 15. Benign Renal Masses

	Angiomyolipoma (Renal Hamartoma)	Renal Oncocytoma	Renal Adenoma
<b>Epidemiology</b>	<1% of adult renal tumours F>M 20% associated with tuberous sclerosis (especially if multiple, recurrent)	3-7% of renal tumours M>F Oncocytomas also found in adrenal, thyroid and parathyroid glands	Most common benign renal neoplasm M:F = 3:1 Incidence increases with age Found in 7-23% of all autopsies
<b>Characteristics</b>	Clonal neoplasm consisting of blood vessels (angio-), smooth muscle (-myo-), and fat (-lipoma) May extend into regional lymphatics and other organs and become symptomatic	Spherical, capsulated with possible central scar Histologically organized aggregates of eosinophilic cells originating from intercalated cells of collecting duct	Small cortical lesions <1 cm Majority are solitary but can be multifocal
<b>Diagnosis</b>	Incidental finding on CT Negative attenuation (-20 HU) on CT is pathognomonic Rare presentation of hematuria, flank pain, and palpable mass (same as RCC)	Incidental finding on CT Difficult to distinguish from RCC on imaging – treated as RCC until proven otherwise Biopsy may be performed to r/o malignancy	Incidental finding on CT Rarely symptomatic Controversy as to whether this represents benign or pre-malignant neoplasm
<b>Management</b>	May consider surgical excision or embolization if symptomatic (pain, bleeding) or higher risk of bleeding (e.g. pregnancy) Follow with serial U/S	Partial/radical nephrectomy for large masses HIFU or RFA for smaller masses	If mass >3 cm, likely not a benign adenoma; will require partial/radical nephrectomy due to increased likelihood of malignancy

## Malignant Renal Neoplasms

### RENAL CELL CARCINOMA (RCC)

#### Etiology

- cause unknown
- originates from proximal convoluted tubule epithelial cells in clear cell subtype (most common)
- hereditary forms seen with von Hippel-Lindau syndrome and hereditary papillary renal carcinoma

#### Epidemiology

- 8th most common malignancy (accounts for 3% of all newly diagnosed cancers)
- 85% of primary malignant tumours in kidney
- male:female = 3:2
- peak incidence at 50-60 yr of age

#### Pathology

- histological subtypes: clear cell (75-85%), papillary (10-15%), chromophobic (5-10%), collecting duct
- sarcomatoid elements in any subtype is a poor prognostic factor

#### Risk Factors

- top 3 risk factors: smoking, HTN, obesity
- miscellaneous: horseshoe kidney, acquired renal cystic disease

#### Clinical Features

- usually asymptomatic: frequently diagnosed incidentally by U/S or CT
- poor prognostic indicators: weight loss, weakness, anemia, bone pain
- classic “too late triad” found in 10-15%:
  - gross hematuria 50%
  - flank pain <50%
  - palpable mass <30%
- was called the “internist’s tumour” because of paraneoplastic symptomatology (see sidebar) – now called the “radiologist’s tumour” because of incidental diagnosis via imaging
- metastases: seen in 1/3rd of new cases; additional 20-40% will go on to develop metastases
  - bone, brain, lung and liver most common sites

#### Investigations

- routine labs for paraneoplastic syndromes (CBC, ESR, LFTs, extended electrolytes)
- U/A (60-75% have hematuria)
- renal U/S: solid vs. cystic lesion
- CT: higher sensitivity than U/S for detection of renal masses and for staging purposes
- MRI: useful for evaluation of vascular extension
- FNA: to confirm diagnosis if considering observation or other non-surgical therapy

#### Staging

- involves CT, CXR, liver enzymes and LFTs, bone scan

Figure 10. RCC staging

Role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC.

**RCC Systemic Effects:** paraneoplastic syndromes (10-40% of patients)

- Hematopoietic disturbances: anemia, polycythemia, raised ESR
- Endocrinopathies: hypercalcemia (increased vitamin D hydroxylation), erythrocytosis (increased erythropoietin), HTN (increased renin), production of other hormones (prolactin, gonadotropins, TSH, insulin, and cortisol)
- Hepatic cell dysfunction or Stauffer syndrome: abnormal LFTs, decreased WBC count, fever, areas of hepatic necrosis; no evidence of metastases; reversible following removal of primary tumour
- Hemodynamic alterations: systolic HTN (due to AV shunting), peripheral edema (due to caval obstruction)

**Table 16. 2010 TNM Classification of Renal Cell Carcinoma**

T	N	M
<b>T1:</b> tumour <7 cm, confined to renal parenchyma <b>T1a:</b> <4 cm <b>T1b:</b> 4-7 cm <b>T2:</b> tumour >7 cm, confined to renal parenchyma <b>T2a:</b> tumour >7 cm but ≤10 cm in greatest dimension, limited to the kidney <b>T2b:</b> tumour >10 cm, limited to the kidney <b>T3:</b> tumour extends into major veins or perinephric tissues, but NOT into ipsilateral adrenal or beyond Gerota's fascia <b>T3a:</b> into renal vein or sinus fat <b>T3b:</b> into infradiaphragmatic IVC <b>T3c:</b> into supradiaphragmatic IVC <b>T4:</b> tumour extends beyond Gerota's fascia including extension into ipsilateral adrenal	<b>N0:</b> no regional nodes <b>N1:</b> metastasis to a single node, <2 cm <b>N2:</b> metastasis to a single node between 2 and 5 cm or multiple nodes <2 cm <b>N3:</b> node >5 cm	<b>M0:</b> no evidence of metastasis <b>M1:</b> presence of distant metastasis

**Treatment**

- surgical
  - radical nephrectomy: en bloc removal of kidney, tumour, ipsilateral adrenal gland (in upper pole tumours) and intact Gerota's capsule and paraaortic lymphadenectomy
  - partial nephrectomy (parenchyma-sparing): <4 cm tumour or solitary kidney/bilateral tumours
  - surgical removal of solitary metastasis may be considered
- ablative techniques (cryoablation, RFA)
- palliative radiation to painful bony lesions
- therapy for advanced stage:
  - anti-angiogenesis/anti-VEGF (e.g. bevacizumab)
  - mTOR inhibitors (e.g. temsirolimus, everolimus)
  - high-dose IL-2 (high toxicity but able to induce long-term remission in 10% of patients)
  - IFN α: monotherapy has been largely replaced by molecularly targeted agents listed above
  - tyrosine kinase inhibitors for metastatic disease (e.g. sunitinib, sorafenib)

**Prognosis**

- stage at diagnosis most important prognostic factor:
  - T1: 90-100% 5-yr survival
  - T2-T3: 60% 5-yr survival
  - metastatic disease: <5% 10-yr survival

Tumour may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli.

**Sorafenib in Advanced Clear-Cell Renal Cell Carcinoma – TARGET Trial**  
*NEJM* 2007;356:125-134

**Study:** Phase III, double-blind RCT comparing multikinase inhibitor, sorafenib, with placebo in treatment of advanced clear-cell renal cell carcinoma.

**Methods:** Patients with clear cell renal cell carcinoma, resistant to standard therapy. The main intervention and outcome were sorafenib and overall survival, respectively.

**Results:** Progression-free survival in intervention group was 5.5 mo, compared with 2.8 mo in the placebo group. The survival improvement was associated with an increased number of adverse events.

**Differential Diagnosis of Filling Defect**

- Urothelial cell carcinoma (differentiate via cytology and CT scan)
- Uric acid stone (differentiate via cytology and CT scan)
- Blood clot
- Pyelitis cystica
- Papillary necrosis
- Fungus ball
- Gas bubble from gas producing organisms

## Carcinoma of the Renal Pelvis and Ureter

**Etiology**

- risk factors include:
  - smoking
  - chemicals/dietary exposures (industrial dyes and solvents; aristolochic acid)
  - analgesic abuse (acetaminophen, ASA, and phenacetin)
  - Balkan nephropathy

**Epidemiology**

- rare: accounts for 5% of all urothelial cancers
- frequently multifocal, 2-5% are bilateral
- M:F = 3:1
- relative incidence: bladder:renal:ureter = 100:10:1

**Pathology**

- 85% are papillary urothelial carcinoma (TCC); others include SCC and adenocarcinoma
- TCC of ureter and renal pelvis are histologically similar to bladder TCC

**Clinical Features**

- gross/microscopic hematuria
- flank pain
- storage or voiding symptoms (dysuria only if lower urinary tract involved)
- flank mass ± hydronephrosis (10-20%)

**Investigations**

- IVP/CT urogram
- cystoscopy and retrograde pyelogram

**Treatment**

- radical nephroureterectomy with cuff of bladder
- distal ureterectomy for distal ureteral tumours

## Bladder Carcinoma

### Etiology

- unknown, but environmental risk factors include:
  - smoking (main factor – implicated in 60% of new cases)
  - aromatic amines: naphthylamines, benzidine, tryptophan, phenacetin metabolites
  - cyclophosphamide
  - prior hx of radiation treatment to the pelvis
  - Schistosoma hematobium* infection (associated with SCC)
  - chronic irritation: cystitis, chronic catheterization, bladder stones (associated with SCC)

The “field defect” theory helps to explain why TCC has multiple lesions and has a high recurrence rate. The entire urothelium (pelvis to bladder) is bathed in carcinogens.

### Epidemiology

- 2nd most common urological malignancy
- male:female = 3:1, white:black = 4:1
- mean age at diagnosis is 65 yr

### Pathology

- classification:
  - TCC >90%
  - SCC 5-7%
  - adenocarcinoma 1%
  - others <1%
- stages and prognoses of urothelial carcinoma at diagnosis:
  - non-muscle invasive (75%) → >80% overall survival
    - 15% of these will progress to invasive TCC
    - the majority of these patients will have recurrence
  - invasive (25%) → 50-60% 5-yr survival
    - 85% have no prior hx of superficial TCC (i.e. *de novo*)
    - 50% have occult metastases at diagnosis, and most of these will develop overt clinical evidence of metastases within 1 yr – lymph nodes, lung, peritoneum, liver
- carcinoma *in situ* → flat, non-papillary erythematous lesion characterized by dysplasia confined to urothelium
  - more aggressive, worse prognosis
  - usually multifocal
  - may progress to invasive TCC

### Clinical Features

- asymptomatic (20%)
- hematuria (key symptom: 85-90% at the time of diagnosis)
- pain (50%) → location determined by size/extent of tumour (i.e. flank, suprapubic, perineal, abdominal, etc.)
- clot retention (17%)
- storage urinary symptoms → consider carcinoma in situ
- palpable mass on bimanual exam → likely muscle invasion
- obstruction of ureters → hydronephrosis and uremia (nausea, vomiting, and diarrhea)

The ENTIRE urinary tract must be evaluated in patients with hematuria unless there is clear evidence of glomerular bleeding (e.g. red cell casts, dysmorphic RBCs, etc.).

### Investigations

- U/A, urine C&S, urine cytology
- U/S
- CT scan with contrast or IVP → look for filling defect
- cystoscopy with bladder washings (gold standard)
- biopsy to establish diagnosis and to determine depth of penetration
- specific bladder tumour markers (e.g. NMP-22, BTA, Immunocyt, FDP)

Unexplained hematuria in any individual >40 yr old must be investigated to r/o a malignancy.

### Grading

- Grade 1: well-differentiated (10% invasive)
- Grade 2: moderately differentiated (50% invasive)
- Grade 3: poorly differentiated (80% invasive)

Cystoscopy is the initial procedure of choice for the diagnosis and staging of urothelial malignancy.

### Staging

- for invasive disease: CT or MRI, CXR, LFTs, extended electrolytes (metastatic work-up)

Tumour grade is the single most important prognostic factor for progression.

**Table 17. 2010 TNM Classification of Bladder Carcinoma (see Figure 11)**

T	N	M
<b>Ta:</b> noninvasive papillary carcinoma <b>Tis:</b> carcinoma in situ (CIS); flat tumour <b>T1:</b> tumour invades submucosa/lamina propria <b>T2a:</b> tumour invades superficial muscle <b>T2b:</b> tumour invades deep muscle <b>T3a:</b> tumour invades perivesical tissue (microscopic) <b>T3b:</b> tumour invades perivesical tissue (macroscopic) <b>T4a:</b> adjacent organ involvement; prostate, uterus, or vagina <b>T4b:</b> adjacent organ involvement; pelvic wall or abdominal wall	<b>N status:</b> as for RCC	<b>M status:</b> as for RCC

**Figure 11. Urothelial carcinoma of bladder****Treatment**

- superficial (non-muscle invasive) disease: Tis, Ta, T1
  - TURBT ± single dose or 6-wk course of intravesical chemo/immuno-therapy (e.g. BCG, mitomycin C) to decrease recurrence rate
  - maintenance with intravesical chemotherapy with BCG may be continued for 2-3 yr
  - high grade disease: TURBT + maintenance BCG OR cystectomy in select patients
- invasive disease: T2a, T2b, T3
  - radical cystectomy + pelvic lymphadenectomy with urinary diversion (e.g. ileal conduit, Indiana pouch, ileal neobladder) or TURBT + chemo-radiation for small tumours
  - neo-adjuvant chemotherapy prior to cystectomy may also be done
  - use of adjuvant chemotherapy after definitive local treatment is controversial
- advanced/metastatic disease: T4a, T4b, N+, M+
  - initial combination of systemic chemotherapy ± irradiation ± surgery

**Prognosis**

- depends on stage, grade, size, number of lesions, recurrence and presence of CIS:
  - T1: 90% 5-yr survival
  - T2: 55% 5-yr survival
  - T3: 20% 5-yr survival
  - T4/N+/M+: <5% 5-yr survival

**Prostatic Carcinoma (CaP)****Etiology**

- not known
- risk factors
  - increased incidence in persons of African descent
  - high dietary fat = 2x risk
  - family hx
    - ♦ 1st degree relative = 2x risk
    - ♦ 1st and 2nd degree relatives = 9x risk

**Epidemiology**

- most prevalent cancer in males
- 3rd leading cause of male cancer deaths (following lung and colon)
- up to 50% risk of CaP at age 50
- lifetime risk of death from CaP is 3%
- 75% diagnosed between ages of 60 and 85; mean age at diagnosis is 72

**Neoadjuvant Chemotherapy plus Cystectomy Compared with Cystectomy Alone for Locally Advanced Bladder Cancer**

NEJM 2003;349:859-866

Study: Randomized clinical trial.

Patients: 317 patients with transitional-cell carcinoma of the bladder (T2N0M0 to T4aN0M0).

Intervention: Randomized to undergo radical cystectomy or to receive three cycles of combined chemotherapy (methotrexate, vinblastine, doxorubicin, and cisplatin) followed by radical cystectomy.

Main outcome: Survival. Secondary objective was to quantify down-staging of tumour following chemotherapy.

Results: At 5 yr after treatment initiation, 57% of the combination-therapy group vs 43% of the cystectomy group were alive ( $p=0.06$ ). In the combination-therapy group, 38% of the patients were pathologically free of cancer at the time of cystectomy vs. 15% of the cystectomy-only group at the time of surgery ( $p<0.001$ ).

Conclusions: For locally advanced bladder carcinoma, neoadjuvant chemotherapy significantly reduces tumour volume and also improves survival.

**Figure 12. Ileal conduit, Indiana pouch, ileal neobladder**

## Pathology

- adenocarcinoma
  - >95%, often multifocal
- urothelial carcinoma (4.5%)
  - associated with TCC of bladder; does NOT follow TNM staging below; not hormone-responsive
- endometrial (rare)
  - carcinoma of the utricle

## Anatomy (see Figure 7)

- 60-70% of nodules arise in the peripheral zone
- 10-20% arise in the transition zone
- 5-10% arise in the central zone

## Clinical Features

- usually asymptomatic
- most commonly detected by DRE, elevated PSA, or as an incidental finding on TURP
  - DRE: hard irregular nodule or diffuse dense induration involving one or both lobes
  - PSA: see *CaP Screening*, U25
- locally advanced disease
  - storage and voiding symptoms, ED (all uncommon without spread)
- metastatic disease:
  - bony mets to axial skeleton common
  - visceral mets are less common (liver, lung, and adrenal gland most common sites)
  - leg pain and edema with nodal mets obstructing lymphatic and venous drainage

## Methods of Spread

- local invasion
- lymphatic spread to regional nodes
  - obturator > iliac > presacral/para-aortic
- hematogenous dissemination occurs early

## Investigations

- DRE
- PSA elevated in the majority of patients with CaP
- TRUS-guided needle biopsy
- bone scan may be omitted in untreated CaP with PSA <10 ng/mL
- CT scanning to assess metastases
- MRI: being investigated for possible role in detection, staging, MRI-guided biopsying and active surveillance

**Table 18. 2010 TNM Classification of Prostate Carcinoma**

T	N	M
<b>T1:</b> clinically undetectable tumour, normal DRE and TRUS <b>T1a:</b> tumour incidental histologic finding in <5% of tissue resected <b>T1b:</b> tumour incidental histologic finding in >5% of tissue resected <b>T1c:</b> tumour identified by needle biopsy (because of elevated PSA level) <b>T2:</b> palpable, confined to prostate <b>T2a:</b> tumour involving ≤ one half of one lobe <b>T2b:</b> tumour involving > one half of one lobe, but not both lobes <b>T2c:</b> tumour involving both lobes <b>T3:</b> tumour extends through prostate capsule <b>T3a:</b> extracapsular extension (unilateral or bilateral) <b>T3b:</b> tumour invading seminal vesicle(s) <b>T4:</b> tumour invades adjacent structures (besides seminal vesicles)	<b>NX:</b> regional lymph nodes were not assessed <b>N0:</b> no regional lymph node metastasis <b>N1:</b> spread to regional lymph nodes	<b>M0:</b> no distant metastasis <b>M:</b> distant metastasis <b>M1a:</b> nonregional lymph nodes <b>M1b:</b> bone(s) <b>M1c:</b> other site(s) with or without bone disease

**Table 19. Prostate Cancer Mortality Risk**

	Low Risk	Moderate Risk (if any of following)	High Risk (if any of following)
PSA	<10	10-20	>20
Gleason Score	<7	7	8-10
Stage	pT1-2a	pT2b-T2c	pT3/4

## Treatment

- T1/T2 (localized, low-risk)
  - if adequate life expectancy or no other significant co-morbidities, consider active surveillance vs. definitive local treatment (RP, brachytherapy, or EBRT)
  - no difference in cure rate between definitive treatment modalities
  - in older population: watchful waiting + palliative treatment for symptomatic progression
- T1/T2 (intermediate or high-risk)
  - definitive therapy over active surveillance
- T3, T4
  - EBRT + androgen deprivation therapy or RP + adjuvant EBRT
- N >0 or M >0
  - requires hormonal therapy/palliative radiotherapy for metastases; may consider combined androgen blockade
  - bilateral orchiectomy – removes 90% of testosterone
  - GnRH agonists (e.g. leuprolide, goserelin)
  - estrogens [e.g. diethylstilbestrol (DES)]
  - antiandrogens (bicalutamide)
  - local irradiation of painful secondaries or half-body irradiation
- hormone-refractory prostate cancer
  - chemotherapy: docetaxel, cabazitaxel, sipuleucel-T

**Table 20. Treatment Options for Localized Prostate Cancer**

Modality	Population Considered	Limitations
Watchful Waiting	Short life expectancy (<5-10 yr); will likely only receive non-curative hormonal therapy if disease progresses	Disease progression
Active Surveillance (serial PSA, DRE, and biopsies)	Low grade disease, good F/U; is still considering more curative treatment if disease progresses	Disease progression; decrease in QOL associated with serial testing; risks associated with biopsies; no optimal monitoring schedule has been defined to date
Brachytherapy	Low volume, low PSA (<10), low grade	ED (50%), long term effectiveness not well-established
EBRT	Locally advanced disease, older patients	Radiation proctitis (5%), ED (50%), risk of rectal cancer
RP	Young patients (<75 yr), high-risk disease	Incontinence (10%), ED (30-50%)

\*Other options include cryosurgery, HIFU, hormonal ablation

## Prognosis

- T1-T2: comparable to normal life expectancy
- T3-T4: 40-70% 10-yr survival
- N+ and/or M+: 40% 5-yr survival
- prognostic factors: tumour stage, tumour grade, PSA value, PSA doubling time

## CaP Screening

### Digital Rectal Exam (DRE)

- should be included as part of initial screening
- suspicious findings: abnormal feeling, nodularity, focal lesion, discrete change in texture/fullness/symmetry

### Prostate Specific Antigen (PSA)

- glycoprotein produced by epithelial cells of prostate gland
- leaks into circulation in setting of disrupted glandular architecture
- value of <4 ng/mL traditionally considered as cut-off to differentiate normal from pathologic value, but no single justifiable cutpoint
- measured serum PSA is a combination of free (15%) and bound PSA (85%)
- PSA velocity, PSA density, and free:total PSA: all intended to increase sensitivity and specificity of serum PSA values

### Screening Recommendations

- conflicting evidence regarding mortality reduction with PSA-based screening and debate regarding overdiagnosis/overtreatment
- Ontario Ministry of Health and Long-Term Care and United States Preventative Services Task Force both recommend against PSA testing as a population-wide screening tool
- serum PSA determination recommended in any man with >10 yr life-expectancy and any of the following:
  - suspicious finding on DRE (see above)
  - moderate-severe LUTS
  - investigating secondary carcinoma of unknown origin to r/o CaP as primary

#### Radical Prostatectomy versus Watchful Waiting in Early Prostate Cancer (Scandinavian Prostate Cancer Group Study)

NEJM 2011;364:1708-1717

**Study:** Randomized clinical trial comparing watchful waiting with radical prostatectomy for localized prostate cancer.

**Methods:** 695 men from 14 centres in Finland, Sweden, and Iceland with newly diagnosed, localized prostate cancer were included in this study.

**Main outcomes:** Mortality, distant metastases, local progression.

**Results:** For men with low-risk prostate cancer (PSA <10, Gleason score <7), at 15 yr after treatment initiation, the relative risk of death due to prostate cancer in the radical prostatectomy group versus watchful waiting was 0.62 (p=0.01). The cumulative incidence of death from prostate cancer after radical prostatectomy was high as compared with other studies.

**Conclusions:** Radical prostatectomy was associated with reduced rate of death due to prostate cancer.

#### Radical Prostatectomy versus Observation for Localized Prostate Cancer. (Prostate Cancer Intervention versus Observation Trial (PIVOT) Study Group)

NEJM 2012;367:203-213

**Study:** Randomized clinical trial comparing observation with radical prostatectomy for localized prostate cancer.

**Methods:** 731 men at 52 United States centres with localized prostate cancer participated.

**Main outcomes:** Mortality, bone metastases, surgical morbidity.

**Results:** Radical prostatectomy did not reduce all-cause or prostate cancer mortality relative to observation (relative risk 0.60, p=0.09), through at least 12 yr of follow-up.

**Conclusions:** Observation is recommended for localized prostate cancer, especially in men with low PSA and low-risk disease.

PSA is specific to the PROSTATE, but NOT to prostate cancer.

#### Causes of Increased PSA

BPH, prostatitis, prostatic ischemia/infarction, prostate biopsy/surgery, prostatic massage, acute urinary retention, urethral catheterization, cystoscopy, TRUS, strenuous exercise, perineal trauma, ejaculation, acute renal failure, coronary bypass graft, radiation therapy.

**Canadian Urological Association Guidelines (2011) re: CaP Screening**

- harms and benefits of PSA testing must be explained to the patient and an informed, shared decision to test must be established
- initial screening should include both serum PSA and DRE
- all men should be offered screening at age 50 if >10 yr life-expectancy
- high-risk individuals (family hx of CaP or African ancestry) should be offered screening at age 40 if >10 yr life-expectancy
- standard has been annual screening, but q2-4 yr screening acceptable
- no strict cutpoint for when to biopsy. Decision to biopsy should be based on more than a single PSA value
- \*new guidelines under development, however, AUA guidelines recommend against universal routine PSA screening for CaP

**Screening for Prostate Cancer.**

*Cochrane DB Syst Rev* 2013;1:CD004720

**Background:** Screening for prostate cancer has an unclear benefit for reducing prostate cancer-specific mortality and morbidity.

**Study:** Systematic review of randomized clinical trials of screening vs no screening. A total of 31 trials were retrieved for this review.

**Results:** A meta-analysis of 5 RCTs with 341,342 participants was done. Collectively, there was no significant reduction in prostate cancer-specific mortality within 10 yr of follow-up. Screening procedures and biopsies were commonly associated with bleeding, bruising, and short-term anxiety; subsequent over-diagnosis and overtreatment resulted in additional harms, some severe.

**Conclusions:** Men who have a life expectancy less than 10 to 15 yr should be informed that screening for prostate cancer is unlikely to be beneficial. Significant harms are associated with screening, over-diagnosis, and overtreatment.

## Testicular Tumours

**Etiology (Risk Factors)**

- cryptorchidism, atrophy, sex hormones, HIV infection, infertility, family hx, past hx of testicular cancer

**Epidemiology**

- rare, but most common solid malignancy in young males 15-34 yr
- any solid testicular mass or acute hydrocoele in young patient – must r/o malignancy
- slightly more common in right testis (corresponds with slightly higher incidence of right-sided cryptorchidism)
- 2-3% bilateral (simultaneously or successively)

**Pathology**

- primary:
  - 1% of all malignancies in males
  - cryptorchidism has increased risk (10-40x) of malignancy
  - 95% are germ cell tumours (all are malignant)
    - ♦ seminoma (35%) → classic, anaplastic, spermatocytic
    - ♦ NSGCT → embryonal cell carcinoma (20%), teratoma (5%), choriocarcinoma (<1%), yolk sac (<<1%), mixed cell type (40%)
  - 5% are non-germ cell tumours (usually benign) → Leydig (testosterone, precocious puberty), Sertoli (gynecomastia, decreased libido)
- secondary:
  - male >50 yr
  - usually lymphoma or metastases (e.g. lung, prostate, GI)

**Clinical Features**

- **painless** testicular enlargement (painful if intratesticular hemorrhage or infarction)
- dull, heavy ache in lower abdomen, anal area or scrotum
- associated hydrocele (10%)
- coincidental trauma (10%)
- infertility (rarely presenting complaint)
- gynecomastia due to secretory tumour effects
- supraclavicular and inguinal lymphadenopathy
- abdominal mass (retroperitoneal lymph node mets)

**Methods of Spread**

- local spread follows lymphatics:
  - right → medial, paracaval, anterior and lateral nodes
  - left → left lateral and anterior paraaortic nodes
  - “cross-over” metastases from right to left are fairly common, but no reports from left to right
- hematogenous most commonly to lung, liver, bones, and kidney

**Investigations**

- diagnosis is established by radical inguinal orchidectomy
- tumour markers:
  - $\beta$ -hCG and AFP are positive in 85% of non-seminomatous tumours
  - elevated marker levels return to normal post-operatively if no secondaries
  - $\beta$ -hCG positive in 7% of seminomas, AFP never elevated with seminoma
- testicular U/S (hypoechoic area within tunica albuginea = high suspicion of testicular cancer)
- evidence of testicular microlithiasis is not a risk factor for testicular cancer
- needle aspiration contraindicated

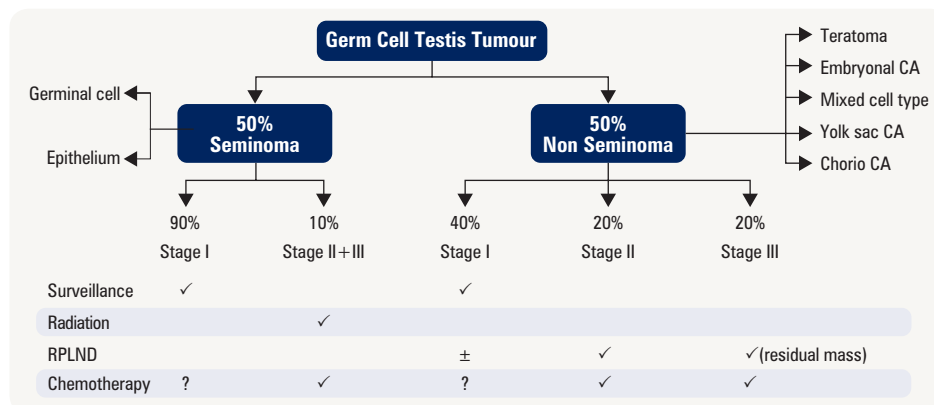

**Management**

- orchiectomy through inguinal ligament for all stages
- consider sperm banking
- adjuvant therapies (see Figure 13)

**Table 21. 2010 TNM Classification of Testicular Carcinoma**

T	N	M
<b>Tis:</b> intratubular germ cell neoplasia <b>T1:</b> limited to testis and epididymis w/o vascular /lymphatic invasion <b>T2:</b> limited to testis and epididymis w/ vascular/lymphatic invasion <b>T3:</b> invasion of the spermatic cord ± vascular/lymphatics <b>T4:</b> invasion of the scrotum ± vascular/lymphatics	N status: same as RCC	<b>M0:</b> no distant mets <b>M1:</b> distant mets <b>M1a:</b> nonregional lymph node(s) or pulmonary mets <b>M1b:</b> distant mets other than to regional lymph nodes and lung

**Figure 13. Adjuvant management of testicular cancer post-orchietomy**

Adapted from Dr. MAS Jewett

**Prognosis**

- 99% cured with stage I and II disease
- 70-80% complete remission with advanced disease

**Penile Tumours****Epidemiology**

- rare (<1% of cancer in males in U.S.)
- most common in 6th decade

**Benign**

- cyst, hemangioma, nevus, papilloma

**Pre-malignant**

- balanitis xerotica obliterans, leukoplakia, Buschke-Lowenstein tumour (large condyloma)

**Pre-invasive Cancer**

- carcinoma *in situ* (CIS):
  - Bowen's disease → crusted, red plaques on the shaft
  - erythroplasia of Queyrat → velvet red, ulcerated plaques on the glans
  - treatment options: local excision, laser, radiation, topical 5-fluorouracil

**Malignant**

- risk factors:
  - chronic inflammatory disease
  - STI
  - phimosis
  - uncircumcised penis
- 2% of all urogenital cancers
- SCC (>95%), basal cell, melanoma, Paget's disease of the penis (extremely rare)
- definitive diagnosis requires full thickness biopsy of lesion
- lymphatic spread (superficial/deep inguinal nodes → iliac nodes) >> hematogenous

**Treatment**

- wide surgical excision with tumour-free margins (dependent on extent and area of penile involvement) ± lymphadenectomy
- consider less aggressive treatment modalities in CIS (cryotherapy, laser therapy, etc.) if available

**Orchiopexy**

Surgical descent (orchiopexy) of undescended testis does not reduce the risk of malignancy. It can reduce the risk of infertility and allows for early detection of tumours by self-exam.

Testes and scrotum have different lymphatic drainage, therefore trans-scrotal approach for biopsy or orchiectomy should be avoided.

**Staging**

Clinical: CXR (lung mets), markers for staging (β-hCG, AFP, LDH), CT abdomen/pelvis (retroperitoneal lymphadenopathy)

- Stage I: disease limited to testis, epididymis, or spermatic cord
- Stage II: disease limited to the retroperitoneal nodes
- Stage III: disease metastatic to supradiaphragmatic nodal or visceral sites

Pathologic (at orchiectomy)

- T1: confined to testis and epididymis, no vascular/lymphatic invasion
- T2: extends beyond tunica albuginea or vascular/lymphatic invasion
- T3: involves spermatic cord
- T4: invades scrotum
- T4a: invades spermatic cord
- T4b: invades scrotal wall

## Scrotal Mass

Table 22. Differentiating between Scrotal Masses

Condition	Pain	Palpation	Additional Findings
<b>Torsion</b>	+	Diffuse tenderness Horizontal lie of testicle	Absent cremaster reflex, negative Prehn's sign
<b>Epididymitis (U15)</b>	+	Epididymal tenderness	Present cremaster reflex, positive Prehn's sign
<b>Orchitis (U15)</b>	+	Diffuse tenderness	Present cremaster reflex, positive Prehn's sign
<b>Hematocele</b>	+	Diffuse tenderness	No transillumination
<b>Hydrocele</b>	–	Testis not separable from hydrocele, cord palpable	Transillumination, hx of trauma
<b>Spermatocele</b>	–	Testis separable from spermatocele, cord palpable	Transillumination
<b>Varicocele</b>	–	Bag of worms	No transillumination, increases in size with Valsalva, decrease in size if supine
<b>Indirect Inguinal</b>	– (+ if strangulated)	Testis separable from hernia, cord not palpable, cough impulse may transmit, may be reducible	No transillumination
<b>Tumour</b>	– (+ if hemorrhagic)	Hard lump/nodule	
<b>Generalized/Dependant edema</b>	–	Diffuse swelling	Often post-op or immobilized, check for liver dysfunction
<b>Idiopathic</b>	–		

### Differential of a Benign Scrotal Mass

#### HIS BITS

**Hydrocele**  
Infection (epididymitis/orchitis)  
**Sperm** (spermatocele)  
**Blood** (hematocele)  
Intestines (hernia)  
**Torsion**  
Some veins (varicocele)

Acute scrotal swelling/pain in young boys is torsion until proven otherwise.

Transillumination refers to if light is able to transmit through tissue (i.e. due to excess fluid).

#### Varicocele Grading

- Grade 1: Palpable only with Valsalva manoeuvre
- Grade 2: Palpable without Valsalva
- Grade 3: Visible through scrotal skin

Table 23. Benign Scrotal Masses

Type	Varicocele	Spermatocele	Hydrocele	Testicular Torsion	Inguinal Hernia
<b>Definition</b>	Dilatation and tortuosity of pampiniform plexus	A benign, sperm filled epididymal retention cyst	Collection of serous fluid that results from a defect or irritation in the tunica vaginalis	Twisting of the testicle causing venous occlusion and engorgement as well as arterial ischemia and infarction	Protrusion of abdominal contents through the inguinal canal into the scrotum
<b>Etiology</b>	15% of men Due to incompetent valves in the testicular veins 90% left sided	Multiple theories, including: Distal obstruction Aneurysmal dilations of the epididymis Agglutinated germ cells	Usually idiopathic Found in 5-10% testicular tumours Associated with trauma/infection Communicating: patent processus vaginalis, changes size during day (peds) Non-communicating: non-patent processus vaginalis (adult)	Trauma Cryptorchidism "Bell clapper deformity" Many occur in sleep (50%) Necrosis of glands in 5-6 h	Indirect (through internal ring, often into scrotum): congenital Direct (through external ring, rarely into scrotum): abdominal muscle weakness
<b>Hx/P/E</b>	"Bag of worms" Often painless Pulsates with Valsalva	Non-tender, cystic mass Transilluminates	Non-tender, intrascrotal mass Cystic Transilluminates	Acute onset severe scrotal pain, swelling GI upsets cases Retracted and transverse testicle (horizontal lie) Negative Phren's sign Absent cremasteric reflex	A small bulge in the groin that may increase in size and disappear when lying down Can present as a swollen or enlarged scrotum Discomfort or sharp pain – especially when straining, lifting, or exercising
<b>Investigations</b>	P/E Valsava	P/E U/S to r/o tumour	U/S to r/o tumour	U/S with colour flow Doppler probe over testicular artery Decrease uptake on <sup>99m</sup> Tc-pertechnetate scintillation scan (doughnut sign)	Hx and P/E Invagination of the scrotum Valsalva
<b>Treatment</b>	Conservative Surgical ligation of testicular veins Percutaneous vein occlusion (balloon, sclerosing agents) Repair may improve sperm count/motility 50-75%	Conservative Avoid needle aspiration as it can lead to infection, reaccumulation and spilling of irritating sperm within scrotum Excise if symptomatic	Conservative Needle drainage Surgical	Emergency manual detorsion (rotate outward) with elective bilateral orchiopexy Failure of manual detorsion: surgical detorsion with orchiopexy Orchiectomy if poor prognosis	Surgical repair

**TORSION OF TESTICULAR APPENDIX**

- twisting of testicular/epididymal vestigial appendix

**Signs and Symptoms**

- clinically similar to testicular torsion, but vertical lie and cremaster reflex preserved
- “blue dot sign”:
  - blue infarcted appendage seen through scrotal skin (can usually be palpated as small, tender lump)

**Treatment**

- analgesia – most will subside over 5-7 d
- surgical exploration and excision if refractory pain

**HEMATOCELE**

- trauma with bleed into tunica vaginalis
- U/S helpful to exclude fracture of testis which requires surgical repair

**Treatment**

- ice packs, analgesics, surgical repair

**Suspect a Retroperitoneal Mass/Process in a Patient with a Varicocele if:**

- Acute onset
- Right sided (isolated)
- Palpable abdominal mass
- Doesn't reduce while supine

**Indications for Treatment of Varicocele**

- Impaired sperm quality or quantity
- Pain or dull ache affecting QOL
- Affected testis fails to grow in adolescents
- Cosmetic indications (especially in adolescents)

## Penile Complaints

### Peyronie's Disease

**Definition**

- benign curvature of penile shaft secondary to fibrous thickening of tunica albuginea
- most commonly on dorsal surface resulting in upward curvature of erect penis

**Etiology**

- exact etiology unknown
- trauma/repeated microtrauma → inflammation → fibrosis
- familial predisposition
- associated with DM, vascular disease, autoimmunity, Dupuytren's contracture, erectile dysfunction
- unclear role of vitamin E deficiency,  $\beta$ -blockade, elevated serotonin

**Clinical Features**

- penile curvature and/or pain with erection
- penile shortening and poor erection distal to plaque

**Treatment**

- limited evidence, depends on pain and interference with intercourse

**Table 24. Treatment of Peyronie's Disease**

Conservative	Medical	Surgical
<ul style="list-style-type: none"> <li>• Reassurance and education</li> <li>• Watchful waiting (spontaneous resolution in up to 50%)</li> </ul>	<ul style="list-style-type: none"> <li>• Vitamin E, colchicine, potassium paraaminobenzoate, and carnitine have all been suggested</li> <li>• Intralesional or topical verapamil</li> </ul>	<ul style="list-style-type: none"> <li>• If stable disease, significant deformity AND failed medical therapy</li> <li>• Incision/excision of plaque</li> <li>• Shortening of less affected side</li> <li>• <math>\pm</math> penile prosthesis</li> </ul>

**Figure 14. Peyronie's disease**

**Mimickers of Peyronie's Disease:**

- Congenital curvature of the penis
- Chordee without hypospadias
- Curvature secondary to penile fracture

### Priapism

**Definition**

- prolonged erection lasting  $>4$  h in the absence of sexual excitement/desire
- tumescence (swelling) of corpora cavernosa with flaccid glans penis (no corpora spongiosum involvement)

**Classification**

- low-flow/ischemic (most common):
  - reduced/absent cavernosal blood flow → hypoxia, acidosis → ischemia
- high-flow/non-ischemic:
  - unregulated arterial flow with normal tissue oxygenation

### Etiology

- primary: up to 50% idiopathic
- secondary:
  - thromboembolic: e.g. sickle cell, thalassemia, total parenteral nutrition, dialysis, leukemia, solid tumours
  - neurogenic: spinal cord injury, autonomic neuropathy
  - traumatic: cavernosal artery laceration, arterio-venous fistula
  - medication: intracavernosal vasoactive drug injection (e.g. triple mix),  $\alpha$ -blockers, anticoagulants, antidepressants, antipsychotics, anxiolytics, PDE-5 inhibitors
  - recreational drugs: cocaine, marijuana, heavy alcohol intake

### Treatment

- treat reversible causes
- high-flow often self-limited, but arterial embolization may be considered
- low-flow:
  1. urgent decompression via needle aspiration
  2. phenylephrine injection into the corpora cavernosa q3-5min (in monitored setting)
  3. shunt creation between cavernosum and spongiosum if no response within 1 h

### Complications

- ED due to corporal fibrosis if treatment delayed
  - 90% risk if >24 h

Ischemic priapism is a urological emergency.

#### Key Differences between Ischemic (I) and Non-Ischemic (NI) Priapism:

Finding	IP	NIP
Rigid corpora cavernosa	U	0
Penile pain	U	0
Abnormal cavernosal blood gases	U	0
CBC abnormalities and hematologic malignancy	S	0
Recent intracavernosal vasoactive drug injection	S	0
Chronic, well-tolerated swelling without full rigidity	0	U
Perineal trauma	0	S

U = Usually present

S = Sometimes present

0 = Seldom present

Source: Guideline on the Management of Priapism. American Urological Association Education and Research, Inc. © 2003.

To prevent paraphimosis, foreskin should always be reduced to normal anatomic position following instrumentation (including following catheterization).

Normal congenital adhesions separate naturally by 3 yr in 90% of uncircumcised boys.

**Erections POINT AND SHOOT**  
parasympathetics = **point**; and  
sympathetics/somatics = **shoot**

## Paraphimosis

### Definition

- foreskin caught behind glans leading to edema → inability to reduce foreskin

### Treatment

- squeeze edema out of the glans with manual pressure (analgesia required)
- pull on foreskin with fingers while pushing on glans with thumbs
- if fails, perform dorsal slit or circumcision
- elective circumcision for definitive treatment (paraphimosis tends to recur)

### Complications

- infection, glans ischemia, gangrene

## Phimosis

### Definition

- inability to retract foreskin over glans penis
- may be caused by balanitis (infection of glans), often due to poor hygiene or congenital

### Treatment

- proper hygiene, topical corticosteroids, dorsal slit, circumcision

### Complications

- balanoposthitis (inflammation of prepuce), paraphimosis, penile cancer

## Erectile Dysfunction (ED)

### Definition

- consistent (>3 mo duration) or recurrent inability to obtain or maintain an adequate erection for satisfactory sexual performance

### Physiology

- erection involves the coordination of psychological, neurologic, hemodynamic, mechanical, and endocrine components
- nerves: sympathetic (T11-L2), parasympathetic (S2-4), somatic [dorsal penile/pudendal nerves (S2-4)]
- erection ("POINT"):
  - parasympathetics → release of nitric oxide (NO) → increased cGMP levels within corpora cavernosa leading to:
    1. arteriolar dilatation
    2. sinusoidal smooth muscle relaxation → increased arterial inflow and compression of penile venous drainage (decreased venous outflow)

- emission (“SHOOT”):
  - sensory afferents from glans
  - secretions from prostate, seminal vesicles, and ejaculatory ducts enter prostatic urethra (sympathetics)
- ejaculation (“SHOOT”)
  - bladder neck closure (sympathetic)
  - spasmodic contraction of bulbo-cavernosus and pelvic floor musculature (somatic)
- detumescence:
  - sympathetic nerves, norepinephrine, endothelin-1 → arteriolar and sinusoidal constriction → penile flaccidity

## Classification

**Table 25. Classification of Erectile Dysfunction**

	Psychogenic	Organic
<b>Proportion</b>	10%	90%
<b>Onset</b>	Sudden	Gradual
<b>Frequency</b>	Sporadic	All circumstances
<b>Variation</b>	With partner and circumstance	No
<b>Age</b>	Younger	Older
<b>Organic risk factors (HTN, DM, dyslipidemia)</b>	No organic risk factors	Risk factors present
<b>Nocturnal/AM erection</b>	Present	Absent

## Etiology (“IMPOTENCE”)

- Iatrogenic: pelvic surgery, pelvic radiation
- Mechanical: Peyronie’s, post-priapism
- Psychological: depression, stress, anxiety, PTSD, widower syndrome
- Occlusive vascular: arterial HTN, DM, smoking, hyperlipidemia, PVD, venous (impaired veno-occlusion)
- Trauma: penile/pelvic, bicycling
- Extra factors: renal failure, cirrhosis, COPD, sleep apnea, malnutrition
- Neurogenic: CNS (e.g. Parkinson’s, MS, spinal cord injury, Guillain-Barré, spina bifida, stroke), PNS (e.g. DM, peripheral neuropathy)
- Chemical: antihypertensives, sedatives, antidepressants, antipsychotics, anxiolytics, anticholinergics, antihistamines, anti-androgens (including 5- $\alpha$  reductase inhibitors), statins, GnRH agonists, illicit drugs
- Endocrine: DM, hypogonadism, hyperprolactinemia, hypo/hyperthyroid

## Diagnosis

- complete hx (include sexual, medical, and psychosocial aspects)
- self-administered questionnaires (e.g. International Index of Erectile Function, Sexual Health Inventory for Men Questionnaire, ED Intensity Scale, ED Impact Scale)
- focused P/E, including vascular and neurologic examinations, secondary sexual characteristics
- lab investigations, dependent on clinical picture
  - risk factor evaluation: fasting blood glucose or HbA1c, cholesterol profile
  - optional: TSH, CBC, U/A, testosterone (free and total), prolactin, LH
- specialized testing including nocturnal penile tumescence monitoring and evaluation of penile vasculature is usually unnecessary

## Treatment

- can often be managed by family doctor, see sidebar for when to refer
- must fully inform patient/partner of options, benefits and complications
- non-invasive:
  - lifestyle changes (alcohol, smoking), psychological (sexual counseling and education)
  - change precipitating medications
  - treat underlying causes (diabetes, CVD, HTN, endocrinopathies)
- minimally invasive:
  - oral medication (see *Common Medications*, U43)
    - ♦ sildenafil, tadalafil, vardenafil: inhibits PDE-5 to increase intracavernosal cyclic GMP levels
      - all three have similar effectiveness, but tadalafil has certain advantages: earlier onset, longer half-life, no cyanopsia, can be taken on empty or full stomach (others better on empty stomach)
  - vacuum devices: draw blood into penis via negative pressure, then put ring at base of penis once erect
  - MUSE: male urethral suppository for erection – vasoactive substance (PGE1) capsule inserted into urethra

Penile vascular abnormalities may be a marker of risk for CV disease. Young men with vascular ED have 50x higher risk of having a CV event.

Testosterone deficiency is an uncommon cause of ED.

### When to Consider Referral

#### FAT PEN

Failed medical therapy  
penile Anatomic abnormality  
pelvic/perineal Trauma  
Psychogenic cause  
Endocrinopathy  
vascular/Neurologic assessment

PDE-5 inhibitors are contraindicated in patients on nitrates/nitroglycerin due to severe hypotension.

- invasive:
  - intracavernous vasodilator injection/self-injection
    - ♦ triple therapy (papaverine, phentolamine, PGE1) or PGE1 alone
    - ♦ complications: priapism (overdose), thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) and hematoma
- surgical:
  - penile implant (last resort): malleable or inflatable
  - penile artery reconstruction (in young men with isolated vascular lesion – investigational)

Initial trial of MUSE or intracavernosal injection should be done under medical supervision.

## Premature Ejaculation

### Definition

- occurrence of ejaculation prior to when one or both partners desire it, either before or soon after penetration
- often thought to be due to psychological factors
- primary premature ejaculation
  - never experienced sexual activity without the presence of premature ejaculation
- secondary premature ejaculation
  - the individual once had acceptable ejaculatory control, but now experiences premature ejaculation, not associated with a general medical condition

### Epidemiology

- 3-30% prevalence (self-reporting is consistently higher than clinical prevalence)
- most common sexual dysfunction reported in men 18-30 yr, associated with secondary impotence in men 45-65 yr

### Investigations

- indicated by hx and P/E
- testosterone levels if in conjunction with impotence

### Treatment

- must r/o and treat any associated general medical conditions (e.g. fear of angina)
- referral to psychiatry, couples counseling or sex therapy
- SSRIs or clomipramine, either daily or on-demand dosing
- topical lidocaine and/or prilocaine

**Efficacy and Safety of Fluoxetine, Sertraline, and Clomipramine in Patients with Premature Ejaculation: a Double-blind, Placebo Controlled Study**

*J Urol* 1998;159:425-427

**Purpose:** To compare the efficacy and safety of fluoxetine, sertraline, clomipramine and placebo for premature ejaculation.

**Methods:** 36 men who had intravaginal ejaculation latency <2 min were recruited. Mean age was 44 yr. Patients took each of 3 drugs and the placebo consecutively during a 4 wk period per each agent. Self-reported questionnaires were used to assess efficacy and side effects.

**Results:** The mean intravaginal ejaculation latency time was significantly increased from 46 s with placebo to 2.27 min, 2.30 min, 4.27 min and 5.75 min, with fluoxetine, sertraline and clomipramine, respectively (all  $p < 0.01$ ). Treatment with clomipramine or sertraline caused a greater increase in mean intravaginal ejaculation latency time than fluoxetine or placebo ( $p < 0.01$ ). Patient sexual satisfaction rate after clomipramine treatment was significantly higher ( $p < 0.05$ ) compared to the other agents. Side effect incidence was higher with clomipramine than fluoxetine, sertraline and placebo ( $p < 0.05$ ).

**Conclusions:** Clomipramine has the best efficacy, but sertraline is nearly as effective with a lower incidence of side effects.

## Trauma

- see [Emergency Medicine](#), ER14

## Renal Trauma

### Classification According to Severity

- minor:
  - contusions and superficial lacerations/hematomas: 90% of all blunt traumas, surgical exploration seldom necessary
- major:
  - laceration that extends into medulla and collecting system, major renal vascular injury, shattered kidney

### Etiology

- 80% blunt (MVC, assaults, falls) vs. 20% penetrating (stab wounds and gunshots)

### Clinical Features

- mechanism of injury raises suspicion
- can be hemodynamically unstable secondary to renal vascular injury and/or other sustained injuries: ABCs
- upper abdominal tenderness, flank tenderness, flank contusions, lower rib/vertebral transverse process fracture

### Investigations

- U/A:
  - hematuria: requires workup but degree does not correlate with the severity of injury
- imaging:
  - CT (contrast, triphasic) if patient stable: look for renal laceration, extravasation of contrast, retroperitoneal hematoma, and associated intra-abdominal organ injury

**Staging (does not necessarily correlate well with clinical status)**

- I: contusion/hematoma
- II: <1 cm laceration without urinary extravasation
- III: >1 cm laceration without urinary extravasation
- IV: urinary extravasation
- V: shattered kidney or avulsion of pedicle

**Treatment**

- microscopic hematuria + isolated well-staged minor injuries → no hospitalization
- gross hematuria + contusion/minor lacerations → hospitalize, bedrest, repeat CT if bleeding persists
- surgical intervention/minimally invasive angiography and embolization:
  - absolute indications:
    - ♦ hemorrhage and hemodynamic instability
  - relative indications
    - ♦ non-viable tissue and major laceration
    - ♦ urinary extravasation
    - ♦ vascular injury
    - ♦ expanding or pulsating peri-renal mass
    - ♦ laparotomy for associated injury
- F/U with U/S or CT before D/C, and at 6 wk

**Complications**

- HTN in 5% of renal trauma

## Bladder Trauma

**Classification**

- contusions: no urinary extravasation, damage to mucosa or muscularis
- intraperitoneal ruptures: often involve the bladder dome
- extraperitoneal ruptures: involve anterior or lateral bladder wall in full bladder

**Etiology**

- blunt (MVC, falls, and crush injury) vs. penetrating trauma to lower abdomen, pelvis, or perineum
- blunt trauma is associated with pelvic fracture in 97% of cases

**Clinical Features**

- abdominal tenderness, distention, peritonitis, and inability to void
- can be hemodynamically unstable secondary to pelvic fracture, other sustained injuries: ABCs
- suprapubic pain

**Investigations**

- U/A: gross hematuria in 90%
- imaging (including CT cystogram and post-drainage films for extravasation)

**Treatment**

- penetrating trauma → surgical exploration
- contusion → urethral catheter until hematuria completely resolves
- extraperitoneal bladder perforations → typically non-operative with foley insertion, and follow with cystograms
  - surgery if: infected urine, rectal/vaginal perforation, bony spike into bladder, laparotomy for concurrent injury, bladder neck involvement, persistent urine leak and failed conservative management
- intraperitoneal rupture usually requires surgical repair and suprapubic catheterization

**Complications**

- complications of bladder injury itself are rare
- mortality is around 20%, and is usually due to associated injuries rather than bladder rupture

## Urethral Injuries

### Etiology

- posterior urethra:
  - common site of injury is junction of membranous and prostatic urethra due to blunt trauma, MVCs, pelvic fracture
  - shearing force on fixed membranous and mobile prostatic urethra
- anterior urethra:
  - straddle injury can crush bulbar urethra against pubic rami
- other causes:
  - iatrogenic (instrumentation, prosthesis insertion), penile fracture, masturbation with urethral manipulation
- always look for associated bladder rupture

All patients with suspected urethral injury should undergo RUG.

### Clinical Features

- blood at urethral meatus
- high-riding prostate on DRE
- swelling and butterfly perineal hematoma
- penile and/or scrotal hematoma
- sensation of voiding without U/O
- distended bladder

### Investigations

- must perform RUG or cystoscopy prior to catheterization

### Treatment

- simple contusions:
  - no treatment
- partial urethral disruption:
  - very gentle attempt at catheterization by urologist
  - with no resistance to catheterization → Foley x 2-3 wk
  - with resistance to catheterization → suprapubic cystostomy or urethral catheter alignment in OR
- periodic flow rates/urethrograms to evaluate for stricture formation
- complete disruption:
  - immediate repair if patient stable, delayed repair if unstable (suprapubic tube in interim)

### Complications

- stricture

## Infertility

### Definition

- failure to conceive after one year of unprotected, properly timed intercourse
- incidence:
  - 15% of all couples
  - ~ 35-40% female, 20% male, 25-30% combined problem

## Female Factors

- see [Gynecology](#), GY22

## Male Factors

### Male Reproduction

- hypothalamic-pituitary-testicular axis (HPTA):
  - pulsatile GnRH from hypothalamus acts on anterior pituitary stimulating release of LH and FSH
  - LH acts on Leydig (interstitial) cells → testosterone synthesis and secretion
  - FSH acts on Sertoli cells → structural and metabolic support to developing spermatogenic cells
  - FSH and testosterone support germ cells (responsible for spermatogenesis)
  - sperm route: epididymis → vas deferens → ejaculatory ducts → prostatic urethra

## Etiology

- idiopathic (40-50% infertile males)
- testicular
  - varicocele (35-40% infertile males)
  - tumour
  - congenital (Klinefelter's triad: small, firm testes, gynecomastia, and azoospermia)
  - post-infectious (epididymo-orchitis, STIs, mumps)
  - uncorrected torsion
  - cryptorchidism (<5% of cases)
- obstructive
  - iatrogenic (surgery: see below)
  - infectious (gonorrhea, chlamydia)
  - trauma
  - congenital (absence of vas deferens, CF)
  - bilateral ejaculatory duct obstruction, epididymal obstructions
  - Kartagener's syndrome (autosomal recessive disorder causing defect in action of cilia)
- endocrine (see [Endocrinology](#), E47)
- HPTA (2-3%) e.g. Kallmann's syndrome (congenital hypothalamic hypogonadism), excess prolactin, excess androgens, excess estrogens
- other
  - retrograde ejaculation secondary to surgery
  - medications (see below)
  - drugs: marijuana, cocaine, tobacco, alcohol
  - increased testicular temperature (sauna, hot baths, tight pants or underwear)
  - chronic disease: e.g. liver, renal
  - unexplained infertility

## History

- age of both partners
- medical: past illness, DM, trauma, CF, genetic syndromes, STIs
- surgical: vasectomy, herniorrhaphy orchidopexy, cryptorchidism, prostate surgery
- fertility: pubertal onset, previous pregnancies, duration of infertility, treatments
- sexual: libido, erection/ejaculation, timing, frequency
- family hx
- medications: cytotoxic agents, GnRH agonists, anabolic steroids, nitrofurantoin, cimetidine, sulfasalazine, spironolactone,  $\alpha$ -blockers
- social hx: alcohol, tobacco, cocaine
- occupational exposures: radiation, heavy metals

## Physical Exam

- general appearance: sexual development, gynecomastia, obesity
- scrotal exam: size, consistency and nodularity of testicles; palpation of cord; DRE; Valsalva for varicocele

## Investigations

- semen analysis (SA) at least 2 properly obtained specimens over several weeks
- hormonal evaluation:
  - indicated with abnormal SA (rare to be abnormal with normal SA)
  - testosterone and FSH
  - serum LH and prolactin are measured if testosterone or FSH are abnormal
- genetic evaluation:
  - chromosomal studies (Klinefelter's syndrome – XXY)
  - genetic studies (Y-chromosome microdeletion, CF gene mutation)
- immunologic studies (antisperm antibodies in ejaculate and blood)
- testicular biopsy
- scrotal U/S (varicocele, testicular size)
- vasography (assess patency of vas deferens)

## Treatment

- assessment of partner
- lifestyle
  - regular exercise, healthy diet
  - eliminate alcohol, tobacco and illicit drugs
- medical
  - endocrine therapy (see [Endocrinology](#), E48)
  - treat retrograde ejaculation
  - discontinue anti-sympathomimetic agents, may start  $\alpha$ -adrenergic stimulation (phenylpropanolamine, pseudoephedrine, or ephedrine)
  - treat underlying infections

### Male Infertility Factors

#### SPERM COUNT

Systemic factor/Smoking

Psychological illness

Endocrinopathy

Retrograde ejaculation

Medications

Chronic disease

Obstructive

Unexplained

Narcotics

Testicular

### WHO Guidelines

#### Normal Semen Values

- Volume: 2-5 mL
- Concentration: >15 million sperm/mL
- Morphology: 30% normal forms
- Motility: >40% adequate forward progression
- Liquefaction: complete in 20 min
- pH: 7.2-7.8
- WBC: <10/HPF or <10<sup>6</sup> WBC/mL semen

Mutation of cystic fibrosis transmembrane conductance regulator (CFTR) gene is associated with congenital bilateral absence of vas deferens and epididymal cysts, even if patient manifests no symptoms of CF.

### Common Terminology on SA:

- Teratospermia: Abnormal morphology
- Asthenospermia: Abnormal motility
- Oligospermia: Decreased sperm count
- Azoospermia: Absent sperm in semen
- Mixed types, i.e. oligoasthenospermia

The majority of men with infertility will show oligospermia and asthenospermia on SA.

- surgical
  - varicocele (if indicated)
  - vasovasostomy (vasectomy reversal)
  - epididymovasostomy
  - transurethral resection of blocked ejaculatory ducts
- assisted reproductive technologies (ART):
  - refer to infertility specialist
  - sperm washing + intrauterine insemination (IUI)
  - in vitro fertilization (IVF)
  - intracytoplasmic sperm injection (ICSI) after CF screening of patient and partner in patients with congenital bilateral absence of vas deferens

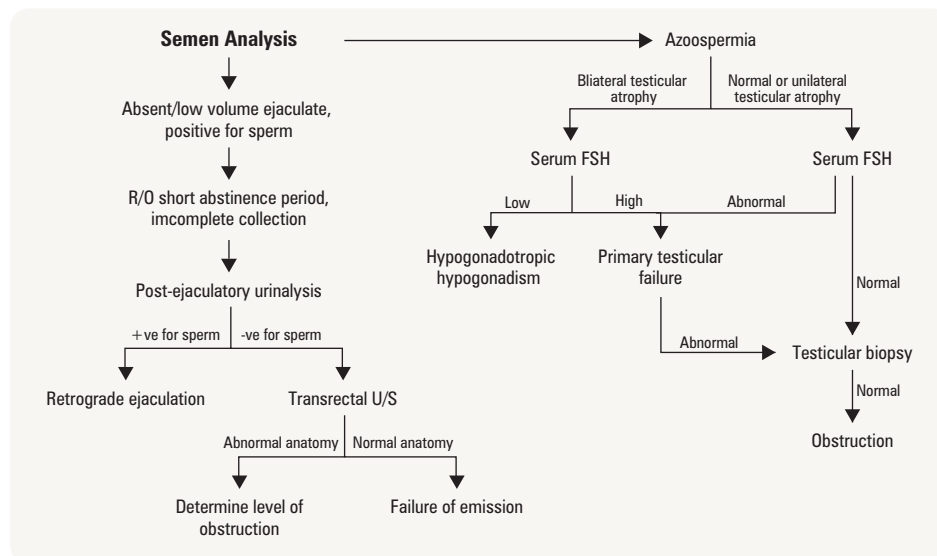

Figure 15. Infertility workup

## Pediatric Urology

### Congenital Abnormalities

- not uncommon; 1/200 have congenital abnormalities of the GU tract
- six common presentations of congenital urological abnormalities:

#### 1. ANTENATAL HYDRONEPHROSIS

##### Epidemiology

- 1-5% fetal U/S, detectable as early as first trimester
- most common urological consultation in perinatal period and one of most common U/S abnormalities of pregnancy

##### Differential Diagnosis

- UPJ or UVJ obstruction
- multi-cystic dysplastic kidney
- VUR
- PUVs (only in boys)
- duplication anomalies
- ureterocele
- ectopic ureter

##### Treatment

- antenatal in utero intervention rarely indicated unless evidence of PUVs with oligohydramnios

Majority of antenatal hydronephroses resolve during pregnancy or within the first year of life.

#### 2. POSTERIOR URETHRAL VALVES (PUV)

##### Epidemiology

- the most common congenital obstructive urethral lesion in male infants

### Pathophysiology

- abnormal mucosal folds at the distal prostatic urethra causing varying degrees of obstruction

### Clinical Presentation

- dependent on age:
  - antenatal: bilateral hydronephrosis, distended bladder, oligohydramnios
  - neonatal (recognized at birth): palpable abdominal mass (distended bladder, hydronephrosis), ascites (transudation of retroperitoneal urine), respiratory distress (pulmonary hypoplasia from oligohydramnios), weak urinary stream
  - neonatal (not recognized at birth): within weeks present with urosepsis, dehydration, electrolyte abnormalities, failure to thrive
  - toddlers: UTIs or voiding dysfunction
  - school-aged boys: voiding dysfunction → urinary incontinence
- associated findings include renal dysplasia and secondary VUR

### Investigations

- most commonly recognized on prenatal U/S → bilateral hydronephrosis, thickened bladder, dilated posterior urethra ("keyhole sign"), oligohydramnios in a male fetus
- VCUG → dilated and elongated posterior urethra, trabeculated bladder, VUR

### Treatment

- immediate catheterization to relieve obstruction, followed by cystoscopic resection of PUV when baby is stable
- if resection of PUV is not possible, vesicostomy is indicated

## 3. URETEROPELVIC JUNCTION (UPJ) OBSTRUCTION

### Etiology

- unclear: adynamic ureteral segment, stenosis, strictures, extrinsic compression, stenosis, strictures, aberrant blood vessels
- can be secondary to tumour, stone, etc.

### Epidemiology

- the most common congenital defect of the ureter
- M:F = 2:1
- up to 40% bilateral, which may be associated with worse prognosis

### Clinical Presentation

- symptoms depend on severity and age at diagnosis (mostly asymptomatic finding on antenatal U/S)
  - infants: abdominal mass, urinary infection
  - children: pain, vomiting, failure to thrive
- some cases are diagnosed after puberty and into adulthood
  - in adolescents and adults, the symptoms may be triggered by episodes of increased diuresis, such as following alcohol ingestion (Dietl's crisis)

### Investigations

- antenatal U/S most common, Doppler U/S (rare), IVP (rare), and renal scan ± furosemide

### Treatment

- surgical correction (pyeloplasty), consider nephrectomy if <15% differential renal function

## 4. VESICoureTERAL REFLUX (VUR)

### Definition

- retrograde passage of urine from the bladder, through the ureterovesicular junction (UVJ), into the ureter

### Classification

- primary reflux: incompetent or inadequate closure of UVJ
  - lateral ureteral insertion, short submucosal segment
- secondary reflux: abnormally high intravesical pressure resulting in failure of UVJ closure
  - often associated with anatomic (PUV) or functional (neurogenic) bladder obstruction

### Epidemiology

- estimated ~1% of newborns, but not well known
- incidence and clinical relevance higher in children with febrile UTIs and prenatal hydronephrosis
- risk factors: race (white > black), female gender, age (<2 yr), genetic predisposition

#### VUR Grading (based on cystogram)

- **Grade I:** ureters only fill
- **Grade II:** ureters and pelvis fill
- **Grade III:** ureters and pelvis fill with some dilatation
- **Grade IV:** ureters, pelvis, and calyces fill with significant dilatation
- **Grade V:** ureters, pelvis, and calyces fill with major dilatation and tortuosity

**Figure 16. VUR grading**  
(based on cystogram)

### Investigations

- focused hx, particularly of voiding dysfunction (frequency, urgency, diurnal enuresis, constipation, encopresis)
  - also screen for signs of infection (UTI, pyelonephritis, urosepsis) and renal failure (uremia, HTN)
- initial evaluation of renal status, growth parameters, and blood pressure is warranted in any child with VUR due to high incidence of renal scarring
  - height, weight, blood pressure
  - Cr
  - U/A, C&S
  - renal U/S
  - DMSA renal scan if at high risk (greater sensitivity than U/S but entails radiation exposure)
  - family screening is controversial

### Treatment

- spontaneous resolution in 60% of primary reflux
  - in lower grades (I-III), goal is to prevent infection or renal damage via medical treatment and monitoring
- medical treatment: long-term ABx prophylaxis at half the treatment dose for half the treatment time (TMP/SMX, trimethoprim, amoxicillin, or nitrofurantoin)
- surgical treatment: ureteral reimplantation ± ureteroplasty, or subureteral injection with bulking agents (Deflux® or Macroplastique®)
  - indications include failure of medical management, renal scarring (e.g. renal insufficiency, HTN), breakthrough UTIs, persistent high grade (IV or V) reflux

## 5. HYPOSPADIAS

### Definition

- a condition in which the urethral meatus opens on the ventral side of the penis, proximal to the normal location in the glans penis
- depending on severity, may result in difficulty directing urinary stream or infertility

### Epidemiology

- very common; 1/300 live male births
- white >> black
- may be associated with ventral penile curvature, disorders of sexual differentiation, undescended testicles or inguinal hernia

### Treatment

- early surgical correction; optimal repair before 2 yr
- neonatal circumcision should be deferred because the foreskin may be utilized in the correction

## 6. EPISPADIAS-EXSTROPHY COMPLEX

### Definition

- a spectrum of defects depending on the timing of the rupture of the cloacal membrane
  - bladder exstrophy: congenital absence of a portion of lower abdominal and anterior bladder wall, with exposure of the bladder lumen
  - cloacal exstrophy:
    - ♦ exposed bladder and bowel with imperforate anus
    - ♦ associated with spina bifida in >50%
  - epispadias (least severe)
    - ♦ urethra opens on dorsal aspect of the penis

### Etiology

- represents failure of closure of the cloacal membrane, resulting in the bladder and urethra opening directly through the abdominal wall

### Epidemiology

- rare: incidence 1/30,000, 3:1 male to female predominance
- high morbidity → incontinence, infertility, reflux

### Treatment

- surgical correction at birth
- later corrections for incontinence, VUR, and bladder capacity may be needed

Defer circumcision in patients with hypospadias.

Figure 17. Classification of hypospadias (\*account for 75%)

## Nephroblastoma (Wilms' Tumour)

### Etiology

- arises from abnormal proliferation of metanephric blastema

### Epidemiology

- 5% of all childhood cancers, 5% bilateral
- most common primary malignant renal tumour of childhood
- average age of incidence is 3 yr

### Clinical Features

- abdominal mass: large, firm, unilateral (80%)
- HTN (25%)
- flank tenderness
- microscopic hematuria
- nausea/vomiting

### Treatment

- always investigate contralateral kidney
- unilateral disease: radical nephrectomy ± radiation ± chemotherapy
- bilateral disease: nephron-sparing surgery following neoadjuvant chemotherapy

### Prognosis

- 5-yr survival 80%

## Cryptorchidism/Ectopic Testes

### Definition

- abnormal location of testes somewhere along the normal path of descent (external inguinal ring > inguinal canal > abdominal)
- ectopic testis (testis found outside its normal path of descent) is most commonly located within a superficial pouch between the external oblique fascia and Scarpa's fascia (Denis Browne pouch)
- differential diagnosis:
  - retractile testes
  - atrophic testes
  - disorders of sexual differentiation (bilateral impalpable gonads)

### Epidemiology

- 2.7% of full term newborns
- 0.7%-0.8% at 1 yr old

### Treatment

- orchiopexy
- hormonal therapy not proven to be of benefit over standard surgical treatment

### Prognosis

- reduction in fertility
  - untreated bilateral cryptorchidism: ~100% infertility
  - paternity rates: 53%, 90%, and 93% in formerly bilateral cryptorchid, formerly unilateral cryptorchid, and normal men, respectively
- increased malignancy risk
  - intraabdominal > inguinal
  - surgical correction facilitates testicular monitoring and may reduce malignancy risk
- increased risk of testicular torsion (reduced by surgical correction)

#### Normal Testicular Development and Descent in Utero

**2nd month:** Testicle begins to form.

**4th month:** Begins to take on its normal appearance and migrates from its origin. at the kidney to the internal inguinal ring.

**7th month:** The testis, surrounded in peritoneal covering, begins to descend through the internal ring, inguinal canal and external ring to terminate in the scrotum.

## Disorders of Sexual Differentiation (DSD)

### Definition

- formerly known as intersex disorders
- abnormal genitalia for chromosomal sex due to the undermasculinization of males or the virilization of females
- considered a social emergency

### Classification

1. 46 XY DSD
  - defect in testicular synthesis of androgens
  - androgen resistance in target tissues
  - palpable gonad

2. 46 XX DSD
  - most due to CAH (21-hydroxylase deficiency most common enzymatic defect) → shunt in steroid biosynthetic pathway leading to excess androgens
  - undiagnosed and untreated CAH can be associated with life-threatening electrolyte abnormalities in the newborn (salt-wasting CAH)
3. ovotesticular DSD
4. mixed gonadal dysgenesis (46 XY/45 XO most common karyotype)
  - presence of Y chromosome → partial testis determination to varying degrees

### Diagnosis

- thorough family hx noting any consanguinity
- maternal hx, especially medication/drug use during pregnancy (maternal hyperandrogenemia)
- P/E: palpable gonad (= chromosomal male), hyperpigmentation, evidence of dehydration, HTN, stretched phallus length, position of urethral meatus
- laboratory tests:
  - plasma 17-OH-progesterone (after 36 h of life) → increased in 21-hydroxylase deficiency (CAH)
  - plasma 11-deoxycortisol → increased in 11-β-hydroxylase deficiency
  - basal adrenal steroid levels
  - serum testosterone and DHT pre- and post-hCG stimulation (2,000 IU/d for 4 d)
  - serum electrolytes
  - chromosomal evaluation including sex karyotype
- U/S of adrenals, gonads, uterus, and fallopian tubes
- endoscopy and genitography of urogenital sinus

### Treatment

- steroid supplementation as indicated (e.g. CAH)
- sex assignment after extensive family consultation
  - must consider capacity for sexually functioning genitalia in adulthood, fertility potential, and psychological impact
- reconstruction of external genitalia between 6 and 12 mo
- long-term psychological guidance and support for both patient and family

#### Male Circumcision for Prevention of Heterosexual Acquisition of HIV in Men

*Cochrane DB Syst Rev* 2009;2:CD003362

**Purpose:** To evaluate the effectiveness and safety of male circumcision for preventing acquisition of HIV in heterosexual men.

**Methods:** The analyzed data is from three randomized controlled trials to assess the efficacy of male circumcision for preventing HIV acquisition in men in Africa.

**Results:** Medical male circumcision reduces the acquisition of HIV by heterosexual men (38%-66% over 24 mo).

#### Circumcision Status and Risk of HIV and Sexually Transmitted Infections among Men who have Sex with Men: A Meta-analysis

*JAMA* 2008;300:1674-1684

**Purpose:** To describe the association between male circumcision and HIV infection and other sexually transmitted infections (STIs) among men who have sex with men (MSM).

**Methods:** Meta-analysis of 15 studies (n = 53 567). The associations between circumcision and HIV-positive and STIs were not statistically significant. Male circumcision had a protective association with HIV in studies of MSM conducted before the introduction of highly active antiretroviral therapy.

**Conclusions:** There is insufficient evidence to support that male circumcision protects against HIV infection or other STIs.

#### Canadian Pediatric Society Position Statement: Neonatal Circumcision Revisited

*CMAJ* 1996;154:769-780

**Objective:** To assist physicians in providing guidance to parents regarding neonatal circumcision.

**Methods:** The literature on circumcision was reviewed by the Fetus and Newborn Committee of the Canadian Paediatric Society.

**Recommendation:** Circumcision of newborns should not be routinely performed. There is inadequate information to recommend circumcision as a public health measure to prevent penile cancer and HIV transmission.

#### Male Circumcision

*Pediatrics* 2012;130:e756-e785

**Study:** Guidelines by the American Academy of Pediatrics (AAP)

**Recommendations:** The American Academy of Pediatrics radically changed their position on male circumcision in 2012. The report from the AAP now states that the preventative health benefits outweigh the risks of the procedure and that the procedure is well-tolerated with adequate pain management and sterility. Stated benefits include the prevention of urinary tract infection, penile cancer, transmission of some sexually transmitted infections, including HIV. There is believed to be no effect on penile sexual function, sensitivity or sexual satisfaction. Acute complications are rare and more common if the procedure is done by an untrained provider.

**Note:** The Canadian Pediatric Society (CPS) has not yet updated their position on male circumcision since 1996, which stated that the CPS is opposed to routine circumcision. A new statement is expected soon.

## Circumcision

### Definition

- removal of some or all of the foreskin from the penis

### Epidemiology

- 30% worldwide
- frequency varies depending on geographic location, religious affiliation, socioeconomic classification

### Medical Indications

- phimosis and recurrent paraphimosis
- recurrent UTIs (particularly in infants and in association with other urinary abnormalities)
- balanitis xerotica obliterans or other chronic inflammatory conditions

### Contraindications

- unstable or sick infant
- congenital genital abnormalities (hypospadias)
- family hx of bleeding disorders warrants laboratory investigation prior to circumcision

### Complications

- bleeding
- infection
- penile entrapment, skin bridges
- fistula
- glans injury
- penile sensation deficits

## Enuresis

- see [Pediatrics](#), P9

## Selected Urological Procedures

### Bladder Catheterization

- catheter size measured by the French (Fr) scale – circumference in mm
- each 1 mm increase in diameter = approximately 3 Fr increase (standard size 16-18 Fr)
- should be removed as soon as possible

#### Continuous Catheterization

- indications:
  - accurate monitoring of U/O
  - relief of urinary retention due to medication, neurogenic bladder, or intravesical obstruction
  - temporary therapy for urinary incontinence
  - perineal wounds
  - clot prevention (24-28 Fr) for CBI
  - post-operative

#### Alternatives to Continuous Catheterization

- intermittent catheterization:
  - PVR measurement
  - to obtain sterile diagnostic specimens for U/A, urine C&S
  - management of neurogenic bladder or chronic urinary retention
- condom catheter
- suprapubic catheter

#### Causes of Difficult Catheterizations and Treatment

- patient discomfort → use sufficient lubrication ( $\pm$  xylocaine)
- collapsing catheter → lubrication as above  $\pm$  firmer catheter (silastic catheter)
- meatal/urethral stricture → dilate with progressively larger catheters/balloon catheter
- BPH → use coude catheter as angled tip can help navigate around prostate
- urethral disruption/obstruction → filiform and followers or suprapubic catheterization
- anxious patient → anxiolytic medication

#### Complications of Catheterization

- infection: UTI
- meatal/urethral trauma

#### Contraindications

- urethral trauma: blood at the meatus of the urethra, scrotal hematoma, pelvic fracture, and/or high riding prostate

## Cystoscopy

#### Objective

- endoscopic inspection of the lower urinary tract (urethra, prostate, bladder, and ureteral orifices), samples for cytology
- scopes can be flexible or rigid

#### Indications

- gross hematuria
- LUTS (storage or voiding)
- urethral and bladder neck strictures
- bladder stones
- bladder tumour surveillance
- evaluation of upper tracts with retrograde pyelography (ureteric stents, catheters)

#### Complications

- during procedure
  - bleeding
  - anesthetic-related
  - perforation (rare)
- post-procedure (short-term)
  - infections, e.g. epididymo-orchitis (rare)
  - urinary retention
- post-procedure (long-term)
  - stricture

**Figure 18. Transurethral (Foley) catheters**

## Radical Prostatectomy (RP)

### Objective

- the removal of the entire prostate and prostatic capsule via a lower midline abdominal incision, laparoscopically or robotically
  - internal iliac and obturator vessel lymph nodes may also be dissected and sent for pathology (dependent on risk: clinical stage, grade, PSA)
  - seminal vesicle vessels are also ligated or removed

### Indications

- treatment for localized prostate cancer

### Complications

- immediate (intraoperative):
  - blood loss
  - rectal injury
  - ureteral injury (extremely rare)
- perioperative:
  - lymphocele formation
- late:
  - moderate to severe urinary incontinence (3-10%)
  - mild urinary incontinence (20%)
  - ED (~50%, depending on whether one, both, or neither of the neurovascular bundles are involved in extracapsular extension of tumour)

**Retropubic, Laparoscopic, and Robot-Assisted Radical Prostatectomy: A Critical Review of Outcomes Reported by High-Volume Centers**  
*J Endourology* 2010;24:2003-2015

**Study:** A systematic review to compare perioperative outcomes, positive surgical margin (PSM) rates, and functional outcomes in retropubic radical prostatectomy (RRP) laparoscopic RP (LRP) and robot-assisted radical prostatectomy (RARP).

**Methods:** Medline database was searched. Weighted means (based on number of participants in each study) were calculated for all outcomes.

**Results:** 58 articles were reviewed. LRP and RARP were associated with better perioperative outcomes compared to RRP. RRP, LRP and RARP had similar post-operative complication rates ranging from 10.3-10.98%. RARP had a lower overall PSM rate than LRP and RRP. RARP had the highest continence rate and mean potency rates.

**Conclusion:** In high-volume centers, RRP, LRP and RARP are safe options for treating patients with localized prostate cancer. LRP and RARP are associated with better peri-operative outcomes and RARP showed lower PSM rates, higher potency and continence compared to RRP and LRP.

## Transurethral Resection of the Prostate (TURP)

### Objective

- to partially resect the periurethral portion of the prostate (transition zone) to decrease symptoms of urinary tract obstruction
- accomplished via a transurethral (cystoscopic) approach using an electrocautery loop, irrigation (glycine), and illumination

### Indications

- obstructive uropathy (large bladder diverticula, renal insufficiency)
- refractory urinary retention
- recurrent UTIs
- recurrent gross hematuria
- bladder stones
- intolerance/failure of medical therapy

### Complications

- acute:
  - intra- or extraperitoneal rupture of the bladder
  - rectal perforation
  - incontinence
  - incision of the ureteral orifice (with subsequent reflux or ureteral stricture)
  - hemorrhage
  - epididymitis
  - sepsis
  - transurethral resection syndrome (also called "post-TURP syndrome")
    - caused by absorption of a large volume of the hypotonic irrigation solution used, usually through perforated venous sinusoids, leading to a hypervolemic hyponatremic state
    - characterized by dilutional hyponatremia, confusion, nausea, vomiting, HTN, bradycardia, visual disturbances, CHF, and pulmonary edema
    - treat with diuresis and (if severe) hypertonic saline administration
- chronic:
  - retrograde ejaculation (>75%)
  - ED (5-10% risk increases with increasing use of cautery)
  - incontinence (<1%)
  - urethral stricture
  - bladder neck contracture

## Extracorporeal Shock Wave Lithotripsy (ESWL)

### Objective

- to treat renal and ureteral calculi (proximal, middle or distal) which cannot pass through the urinary tract naturally
- shockwaves are generated and focused onto stone → fragmentation, allowing stone fragments to pass spontaneously and less painfully

### Indications

- potential first-line therapy for renal and ureteral calculi <2.5 cm
- individuals with calculi in solitary kidney
- individuals with HTN, DM or renal insufficiency
- \*patient preference and wait-times play a large role in stone management

### Contraindications

- acute UTI or urosepsis
- bleeding disorder or coagulopathy
- pregnancy
- obstruction distal to stone

### Complications

- bacteriuria
- bacteremia
- post-procedure hematuria
- ureteric obstruction (by stone fragments)
- peri-nephric hematoma

#### A Comparison of Treatment Modalities for Renal Calculi Between 100 and 300 mm<sup>2</sup>: Are Shockwave Lithotripsy, Ureteroscopy, and Percutaneous Nephrolithotomy Equivalent?

*J Endourol* 2011;25:481-485

**Purpose:** To describe the outcomes of a series of patients who underwent shockwave lithotripsy (SWL), ureteroscopy (URS) or percutaneous nephrolithotomy (PCNL).

**Methods:** Patients treated for intermediate-sized upper tract calculi (100-300 mm<sup>2</sup>) at a single tertiary centre were included. Demographic and clinical data were collected from a prospectively maintained database.

**Results:** Of a 137 patients, 38.7%, 29.9%, and 31.4% were treated with SWL, URS, and PCNL, respectively. Stone-free rate (95.3%) and single treatment success rate (95.3%) were highest for PCNL compared to SWL and URS ( $p < 0.001$ ). When allowing for up to two SWL treatments, success rates became equivalent for the three treatment groups ( $p = 0.66$ ). Auxiliary treatments were more frequent after SWL compared to URS and PCNL. Clavien grade complications did not differ between the three groups.

**Conclusion:** Up to two SWL treatments have equivalent success rate as compared to URS and PCNL. Hence, multiple SWL treatments may be a reasonable therapeutic option for patients who prefer SWL or who are not good candidates for alternative therapies.

## Common Medications

**Table 26. Erectile Dysfunction Medications**

Drug	Class	Mechanism	Adverse Effects
sildenafil tadalafil vardenafil (for use when some erection present)	Phosphodiesterase 5 inhibitor	Selective inhibition of PDE5 (enzyme which degrades cGMP) Leads to sinusoidal smooth muscle relaxation and erection	Severe hypotension (very rare) Contraindicated if hx of priapism, or in conditions predisposing to priapism (leukemia, myelofibrosis, polycythemia, sickle cell disease) Contraindicated with nitrates
alprostadil (MUSE), PGE <sub>1</sub> + phentolamine + papaverine mixture	Prostaglandin E <sub>1</sub>	Activation of cAMP, relaxing sinusoidal smooth muscle Local release (capsule inserted into urethra)	Penile pain Presyncope
alprostadil, papaverine (intracavernosal injection)	See above	See above	Thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) Painful erection Hematoma Contraindicated if hx of priapism, or in conditions predisposing to priapism
triple therapy also used: papaverine, phentolamine, PGE <sub>1</sub>			

**Table 27. Benign Prostatic Hyperplasia Medications**

Drug	Class	Mechanism	Adverse Effects
terazosin doxazosin	$\alpha_1$ blockers	$\alpha$ -adrenergic antagonists reduce stromal smooth muscle tone Reduce dynamic component of bladder outlet obstruction	Presyncope Leg edema Retrograde ejaculation
tamsulosin alfuzosin	$\alpha_{1A}$ selective		Headache Asthenia Nasal congestion
finasteride dutasteride	5 $\alpha$ -reductase inhibitor	Blocks conversion of testosterone to DHT Reduces static component of bladder outlet obstruction Reduces prostatic volume	Sexual dysfunction PSA decreases

**Table 28. Prostatic Carcinoma Medications (N>0, M>0)**

Drug	Class	Mechanism	Adverse Effects
leuprolide, goserelin	GnRH agonist	Initially stimulates LH, increasing testosterone and causing "flare" (initially increases bone pain) Later causes low testosterone	Hot flashes Headache Decreased libido
*diethylstilbestrol (DES)	Estrogens	Inhibit LH and cytotoxic effect on tumour cells	Increased risk of cardiovascular events (no longer available commercially in North America)
*cyproterone acetate	Steroidal antiandrogen	Competes with DHT for intracellular receptors: 1. Prevent flare produced by GnRH agonist 2. Use for complete androgen blockade 3. May preserve potency	
flutamide, bicalutamide	Non-steroidal antiandrogen	As above	Hepatotoxic: AST/ALT monitoring
*ketoconazole, spironolactone	Steroidogenesis inhibitors	Blocks multiple enzymes in steroid pathway, including adrenal androgens	GI symptoms Hyperkalemia Gynecomastia

\*Very rarely used

**Table 29. Continence Agents and Overactive Bladder Medications**

Drug	Class	Mechanism	Indication	Adverse Effects
oxybutynin	Antispasmodic	Inhibits action of ACh on smooth muscle Decreases frequency of uninhibited detrusor contraction Diminishes initial urge to void	Urge incontinence + urgency + frequency	Dry mouth Blurred vision Constipation Supraventricular tachycardia
oxybutynin, tolterodine, trospium, solifenacin, darifenacin	Anticholinergic	Muscarinic receptor antagonist Selective for bladder Increases bladder volume Decreases detrusor pressure	Urge incontinence + urgency + frequency	As above
imipramine	Tricyclic antidepressant	Sympathomimetic effects: urinary sphincter contraction Anticholinergic effects: detrusor relaxation	Stress and urge incontinence	As above Weight gain Orthostatic hypotension Prolonged PR interval

Note: All anti-cholinergics are equally effective and long-acting formulations are better tolerated. Newer muscarinic M3 receptor specific agents (solifenacin, darifenacin) are equally efficacious as older drugs, however, RCTs based on head-to-head comparison to long acting formulations are lacking.
